- Strong enhancement of signal strength
- Most easy application
- Compatible with
  Western and ELISA
  HRP and AP
  all common membranes
  all common substrates

The Signal Enhancer Western/ELISA enhances antigen-antibody reactions in a variety of immunoassays such as Western blotting, dot blotting and ELISA. It can significantly enhance detection of weak immunoreactive and low abundance target proteins and is well compatible with all common assay versions, membranes and ELISA plates.
Signal enhancement is dependent on several parameters such as the particular antigen/antibody pair, the particular detection enzyme, the substrate chosen and so on. In most cases, however, the signal strength is about 5 to 10fold higher than with the substrate alone. For application, the two solutions Signal Enhancer Western/ELISA-1 and -2 are simply used as buffer solutions for preparation of the primary- and secondary antibody incubation solutions. Following incubation and washing, all common detection procedures may be applied, for instance colour staining with Roti®-DAB-Kit (Art. No. 9202) or chemoluminescent staining with Roti®-Lumin plus (Art. No. 3692).

This Kit contains:
Signal Enhancer Western/ELISA-1 (Art. No. 9213) and Signal Enhancer Western/ELISA-2 (Art. No. 9214). 1 Mini-Set: 2 x 50 ml, 1 Set: 2 x 250 ml.

One set with 250 ml each is sufficient for optimization of approx. 25 minigel blots.

Signal Enhancer Western/ELISA-1

for immunochemistry

For optimisation of primary antibody binding in immunochemical assays.

Storage temp.: +4 °C • Transport temp.: cooled

The solution Signal Enhancer Western/ELISA-1 enhances reaction between antigens and their corresponding **primary** antibodies in a variety of immunoassays such as Western blotting, dot blotting and ELISA.

One bottle with 250 ml is sufficient for approx. 25 assays.

Signal Enhancer Western/ELISA-2

for immunochemistry

For optimisation of binding of primary and labelled antibodies in immunochemical assays.

Storage temp.: +4 °C • Transport temp.: cooled

The solution Signal Enhancer Western/ELISA-2 enhances binding of **secondary** antibodies in a variety of immunoassays such as Western blotting, dot blotting and ELISA. The solution is well compatible with all common assay versions, membranes and ELISA plates.

Recommended for performance of assays using one antibody only, which is labelled.

One bottle with 250 ml is sufficient for approx. 25 assays.

Roti®-Free Slide Enhancer

RNAse-/DNAse-free

10x conc., BioScience-Grade

Concentrated buffer for enhancement of detection signals in immunohistochemistry and *in situ* hybridization.

Storage temp.: +20 °C

- Very effective
- Gentle
- Odour-free
- Simple application
- Suitable for formaline- and paraffin fixed samples and cryo sections

Efficient stripping buffer for removal of antibodies, probes, and corresponding stains from immunohisto- and -cytochemical samples, as well as from *in situ* hybridizations.
Due to the particularly adjusted formulation of the Roti®-Free Slide Stripping Buffer, antigens and hybridization partners are retrieved very gently, but quantitatively, enabling the samples to be assayed repeatedly. Suitable for all common samples like formaline- and paraffin fixed tissue and cells, or cryo sections.

Applications: The slides are incubated in Roti®-Free Slide Stripping Buffer for 20-40 min at 70-95 °C. After repeated washing steps, the samples may be assayed again with antibodies or probes. The particular parameters necessary for complete stripping depend on the respective samples, fixing-, and detection systems.

A/a: Standard detection in 1 % triton-PBS buffer, w/o pretreatment.

With kind permission of the RIKEN Brain Science Institute (BSI), Development Research Group, Hirosawa Wako City, Saitama, Japan.

One bottle with 500 ml is sufficient for approx. 500 slides.

Accessories

Western Incubation Trays

reusable

Compatible with all standard Western-staining methods.

Western incubation trays have been specially developed for staining Western-blots. The sizes adapted to suit typical Western-blots, reduce the required quantity of antibodies and staining reagents. The trays are compatible with all standard staining methods and can easily be stacked. The airtight lids effectively prevent the solution from evaporating even during longer incubation periods.

Blot incubation trays

A 121 °C

reusable

Compatible with Western- and Southern blotting methods

Developed for incubation of filter membranes during signal detection after Western- and Southern blotting. The incubation trays can safely be stacked, and, due to the tightly sealing lids, evaporation of solution is prevented even during long incubation periods. The size, adapted to typical membrane sheets, reduces the amount of buffer needed during incubation. In case of version MINI, the 5 trays may be used separately as well as in uniform. Stabile, autoclavable, and reusable.

Made from polypropylene.

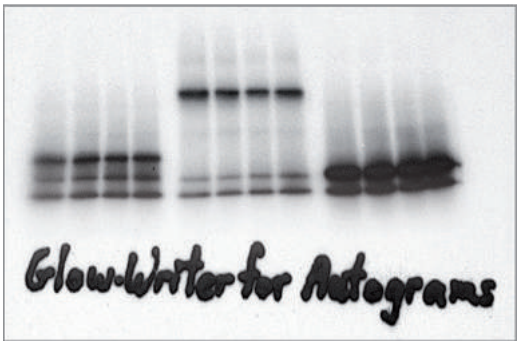
Luminous stencil



reusable

Orienting and measuring aid for detection of blot membranes.

Stencil with phosphorescent ordinate system and a pattern of different sized electrophoresis comb wells. When activated, stencils fluoresce for approx. 15 minutes. Are ideal for controlling and measuring during chemoluminescence detection of blots. Stencil can be activated by exposure to daylight or to artificial light.

Autoradiography Pen

For marking of chemoluminescent or isotope labelled sheets prior to autoradiographic detection.

Pen with phosphorous ink for easy marking of those membranes ready for exposure. The fine tip of the pen also allows individual bands and gel tracks to be marked simply and easily. The marking is activated by the light in the room prior to exposure. The ink illuminates the X-ray film during exposure and the letters are visible in black ink. The letters are easy to read even after short exposure time. In the event of long exposure, the short half-life value of 2-3 minutes effectively prevents overexposure. The writing is therefore easy to make out after virtually all exposure times. Through the replacement nibs the pen can be reused even after a number of months or after drying out.

Suitable for chemoluminescence and isotope-radiography.
Ideal for marking paper, plastic foil and dried polyacrylamide gels.

CELLPURE® ready-to-use, sterile

Medium for analysis of hormones and growth factors in cell culture.

Dulbecco's Modified Eagle Medium + Ham's F12 medium (1:1)

Storage temp.: +4 °C

Dulbecco's Modified Eagle Medium is the most commonly used modification of the Basal Medium acc. to Eagle. This mixture of DMEM High Glucose with Ham's F12 medium combines the high nutritional value of Ham's F12 medium with the high concentration of amino acids, vitamins, and glucose of DMEM.

Roti®-CELL Eagle's MEM / Earle's

CELLPURE® ready-to-use, sterile

Medium for a wide range of mammalian cell culture applications.

Minimum Essential Medium acc. to Eagle with Earle's salts

Storage temp.: +4 °C

Minimum Essential Medium is a commonly used modification of the Basal Medium acc. to Eagle, having been developed in 1959 for culturing of HeLa cells. EMEM contains high concentration of amino acids, which conform closely to the protein composition of human cells. Concentration of vitamins, and other essential nutrients, is enhanced, allowing longer cultivation periods between feedings. EMEM is well suited for culturing of a wide range of mammalian cell lines and primary cells, also including transfected cells.

Special Media ready-to-use S

Roti®-CELL Ham's F12

CELLPURE® ready-to-use, sterile

Medium for culturing of a variety of mammalian- and hybridoma cells, especially CHO cells.

Ham's F12 cell culture medium

Storage temp.: +4 °C

Ham's F12 Medium was originally optimized for serum-free, clonal culturing of CHO cells (Chinese Hamster Ovary). Ham's F12 Medium is the medium of choice for culturing cells of rodent orgin, particularly from rabbit and rat. Additionally, it is increasingly used as general purpose medium for culturing mammalian and hybridoma cells, particularly when supplemented with sera, hormones, and transferrin.

Medium for culture of mammalian cells without CO_2 atmosphere.

Leibovitz's cell culture medium

Storage temp.: +4 °C

Leibovitz's L15 Medium was developed for culturing of eukaryotic cells without CO_2 enriched atmosphere. Its unique components include the use of galactose instead of glucose, omittance of bicarbonate, addition of free base forms of arginine, cysteine, and histidine, as well as elevated levels of tyrosine. Leibovitz's L15 Medium is still used to grow cell lines in the absence of CO_2.

Cell Culture Media Additives S

Roti®-CELL Bicarbonate solution

CELLPURE® sterile, 7,5 %

For cell culture

Sodium bicarbonate solution in water

Due to it being the main physiological buffer system, sodium bicarbonate still is the most commonly used buffer in cell culture media. For media with Hanks' Salts (HBSS) add a low concentration of Roti®-CELL Bicarbonate solution (350 mg/l = 0,035 % end concentration) and incubate in closed culture vessels. For media with Earle's Salts (EBSS) add a higher concentration of Roti®-CELL Bicarbonate solution (2.200 mg/l = 0,22 % end concentration) and incubate in an open vessel, in an atmosphere supplied with 5 % CO_2 in air.

Roti®-CELL Glutamine solution

CELLPURE® sterile, 200 mM

Temperature-stable. For cell culture

Alanyl-L-glutamine solution in 145 mM NaCl

L-glutamine is an essential amino acid required for cell culture growth and is normally present in media in a concentration of 29 mg/l or 2 mM. While standard L-glutamine is temperature-sensitive and thus not stable for longer periods, the L-Glutamine form used for this Roti®-CELL Glutamine solution extends by temperature stability and may be stored at room temperature for years, making it a highly valuable tool for cell culture media. Stable L-glutamine is used in the same concentration as standard, temperature-sensitive L-glutamine.

HEPES solution in 145 mM NaCl

Roti®-CELL HEPES solution has been designed for use in open vessels incubated under atmospheric conditions. The sodium chloride concentration of Roti®-CELL HEPES solution has been adapted to the Osmolality found in standard cell culture media formulations, in order to maintain physiological Osmolality in culture.

Roti®-CELL MEM-AA solution

CELLPURE® sterile, 50x conc., w/o glutamine

For cell culture.

Essential amino acids, solution in water

Storage temp.: +4 °C • Transport temp.: cooled

Roti®-CELL MEM-AA solution consists of a mixture of 12 essential amino acids in water. Since cells are not able to synthesize essential amino acids by themselves, those have to be externally supplemented. By enrichment of cell culture media with Roti®-CELL MEM-AA, the culture medium is supplemented with a preformulated mixture of essential amino acids perfectly suited for culturing of most eukaryotic cells. For each amino acid, dilution by 1:50 of Roti®-CELL MEM-AA solution yields the final concentration known from Eagle's Minimum Essential Medium.

Roti®-CELL MEM-NEAA solution

CELLPURE® sterile, 100x conc., 10 mM each

For cell culture

Non essential amino acids, solution in water

Storage temp.: +4 °C

Roti®-CELL MEM-NEAA solution consists of a mixture of 7 non-essential amino acids in water. Enrichment of Roti®-CELL Eagle's MEM Medium (with Earle's or Hanks' salts) with non-essential amino acids enables culturing of fastidious cells and cell lines, hereby broadening the utility of this medium. Dilution by 1:100 of Roti®-CELL MEM-NEAA solution yields a final concentration 0.1 mM of each component.

Roti®-CELL Pyruvate solution

CELLPURE® sterile, 100 mM

For cell culture

Sodium pyruvate solution in water

Storage temp.: +4 °C

Sodium Pyruvate is a key intermediate in the ATP production within the cell and is sometimes added to cell culture media as an additional source of energy. Additional pyruvate may help cells deficient in one of the enzymes involved in glucose metabolism, and may kick-start cells in the citric acid cycle, thus supporting growth of low density cells.
Concentration in standard media is 1 mM; special media like Leibovitz's medium are supplemented with up to 5 mM pyruvate.

Reagents for Cell Culture
General Reagents

Albumin Fraction V, endotoxin-tested
>98 %, low endotoxin, CELLPURE®

With low endotoxin content. Recommended for culturing of cell lines.
BSA
M ~66 000 g/mol
Storage temp.: +4 °C
Albumin Fraction V, low endotoxin is recommended for use during culturing of eukaryotic cells.
Bovine serum albumin is basically suitable for stabilisation of all enzymes and antibodies, as well as for blocking of hybridisations and immunoassays.
Manufactured from fresh beef plasma by fractionating in accordance with Cohn and subsequent crystallisation at low temperatures from the alcohol solution.
Molar extinction coefficient: 44.020 · M^{-1} · cm^{-1} (acc. to 0.667 x cm^{-1} for a 0.1 % solution).

Albumin Fraction V, very low endotoxin
>98 %, very low endotoxin, CELLPURE®

With extremely low endotoxin content. Recommended for the culture of primary cells and cell lines, as well as for sensitive cell culture assays.
BSA
M ~66 000 g/mol
Storage temp.: +4 °C
Albumin Fraction V, very low endotoxin is particularly recommended for use during culturing of eukaryotic cells and in cell culture assays. This albumin of superior quality is thoroughly tested for its very low endotoxin content, therefore providing trouble-free cell culture assays and reliable results even when handling primary cells or stem cells.
Bovine serum albumin is basically suitable for stabilisation of all enzymes and antibodies, as well as for blocking of hybridisations and immunoassays.
Manufactured from fresh beef plasma by fractionating in accordance with Cohn and subsequent crystallisation at low temperatures from the alcohol solution.

Sodium chloride (tablet)

Exactly pre-weighed tablets for convenient and rapid preparation of sodium chloride solution.
Sodium chloride solution is generally used in many routine processes in Life Science laboratories, for instance preparation of salt solutions or composing of special buffer concoctions. In order to alleviate the effort involved, preparation of salt solutions using the Roti®fair salt tablets is most convenient.
Prepared solution may be sterilized by filtration (0,22 µm) or autoclaving.
For long-term storage, salt solution should be kept at +4 °C.
0,9 % NaCl solution is prepared by dissolution of 1 tablet in 1000 ml or 100 ml highly pure water, respectively.

Roti®-CELL 0.1% Gelatine solution
sterile, 0,1 % conc., in PBS w/o Ca/Mg

From porcine skin, for cell culture, protein biochemistry and molecular biology.

Gelatine solution

Storage temp.: +4 °C • Transport temp.: cooled

Roti®-CELL 0.1% Gelatine solution may be used in a variety of applications in Life Science research in general. The following applications, however, are amongst the most popular: coating of cell culture wells in order to improve cell adhesion of various cell types, stabilizing of DNA polymerases, blocking additive in immunochemical assays, and species differentiation processes in microbiology.
Gelatine is a heterogeneous mixture of water-soluble proteins of high average molecular masses, present in collagen.

Recommended use of Roti®-CELL 0.1% Gelatine solution for cell culture coating: 100-200 µg (0,1-0,2 ml)/cm². Hence, we recommend to use the following amounts per well/plate in ml: 0,1-0,2(48well), 0,2-0,4(24well), 0,4-0,8(12well), 1-1,9(6well), 2,8-5,7(6 cm plate), 8-15,7(10 cm plate). The optimal amount depends on the cell type and specific assay parameters and has to be evaluated. Coat by incubation at 37 °C for 30 mins in minimum.

For research use only. Not approved for human or veterinary use, for application to humans or animals, or for use in clinical or *in vitro* diagnostics.

Endotoxins (greek ἐndo [endo]=inner, within; τοξίνη [toxin]=poison, toxic substance).

Largest subgroup of **pyrogens** (greek πψροσ [pyros]=fire; γενναν [gennan]=to produce).

The terms **endotoxin** and **pyrogen** are often used synonymously.

Lipopoly saccharides from the outer cell membrane of gram-negative bacteria or blue-green algae. The pathological effects of **endotoxins** are microbial poisoning, septicaemia and lung disease. The lipid A contained in endotoxins is toxic to eukaryotic cells since it interacts with the cell membrane and affects the transcription of many proteins (e.g. tumour necrosis factor). It is, therefore, important to use reagents that are to a large degree free of endotoxins / pyrogens in the **cell culture.**

This can be verified by older test methods such as induction of fever in rabbits, the LAL test (the haemolymph of the horseshoe crab *limulus polyphemus* coagulates in the presence of endotoxins) or by using modern and animal-friendly methods such as monocyte activation or ELISA.

1 E.U. (Endotoxin Unit) = 1 I.U. (International Unit) = 1 USP.U. (United States Pharmocopeia Unit)

1 E.U. = approx. 0,1 ng endotoxin

Antibiotics for Cell Culture

Contamination of a cell culture by bacteria or yeasts almost always results in loss of the cell lines and assays, which means that the use of antibiotics has an important role to play in addition to working in sterile conditions. Antibiotics which are predominantly used for prophylactic purposes are ampicillin, streptomycin and penicillin, while ciprofloxacin and nystatin are used for the eradication of mycoplasma and mould/yeasts.
In molecular biology, antibiotics – particularly G418, hygromycin and neomycin – were established in combination with appropriate resistance genes as selection markers for successfully transfected cells.
Reaction mechanisms of antibiotics used in cell culture mainly involve interference with membrane biosynthesis, membrane integrity or the ribosomal processes in protein biosynthesis.

Roti®-CELL Myco-Free

ready-to-use S

CELLPURE® 50x conc., ready-to-use, sterile

For elimination of mycoplasm contamination in cell culture.
Mycoplasm eradication solution
Storage temp.: -20 °C • Transport temp.: cooled

Application: Culture media are supplemented by the Roti®-CELL Myco-Free stock solution diluted by 1:50. Mycoplasms and bacteria are reliably and efficiently eliminated.

- Simple Application
- Reliable eradication
- Effective against all mycoplasms and bacteria
- Not cytotoxic

Roti®-CELL Myco-Free is a reliable, rapidly effective reagent for eradication of contaminations by mycoplasms and other bacteria in cell culture.
The sterile solution Roti®-CELL Myco-Free is composed of a mixture of specially selected antibiotics in PBS, which are known to be highly potent, even in very low concentrations. The effect is due to a specific interaction with prokaryotic protein biosynthesis by inhibition of translation and of the transcription complex located gyrase. Eukaryotic cells are not affected.

One bottle of 100 ml is sufficient for approx. 300 applications.

Amino Acids for Cell Culture

In addition to containing a defined amount of L-glutamine and other essential amino acids, cells in culture media require a series of other amino acids, such as additives to Iscove's Modified Dulbecco Media or nonessential amino acid mixtures to Minimum Essential Media (MEM). Only highly pure reagents tested for the absence of pyrogens/endotoxins can be used for the cell culture.
ROTH offers CELLPURE® grade amino acids with high purity and a guaranteed low endotoxin content.

Cell Passage

Roti®-CELL DPBS/EDTA S

CELLPURE® sterile, 0,02 % EDTA (Versene®), w/o Ca/Mg

Balanced salt solution with EDTA for cell culture.

EDTA solution in DPBS

EDTA, a chelator of divalent cations, is used combined with trypsin prior to passaging in order to solubilize adherent cells from the culture vessel surface into suspension. EDTA binds calcium and magnesium which aid in cell-cell adhesion, additionally allowing trypsin to more efficiently hydrolyze specific peptide bonds.
Roti®-CELL DPBS/EDTA may also be used directly without addition of trypsine for very gentle cell dissociation. Versene® is a trade-marked name of EDTA.

For research use only. Not approved for human or veterinary use, for application to humans or animals, or for use in clinical or *in vitro* diagnostics.

Trypsin TSE-/BSE-free

5000 USP-U/mg, free from salt

Isolated from porcine pancreas, lyophilised.

M ~24,000 g/mol

Storage temp.: -20 °C • Transport temp.: room temp.

Danger H334-H335-H315-H319

A pancreatic serine protease with a specificity for peptide bonds between basic amino acids arginine or lysine and another non-specific amino acid. Trypsin is frequently used to suspend cells which grow as monolayers on surfaces. Longer exposure to trypsin can damage cells, so that an inhibitor (serum or trypsin inhibitor from soya beans) should be added upon completion.
One USP Unit will cause an increase in absorption (253 nm) per minute of 0,003 at 25 °C and pH 7,6 using BAEE as substrate.
One (international) Unit (U, 255 nm, BAEE, pH 8) is approx. 90 USP U.
One TAME Unit is approx. 20 USP Units. One NF Unit is one USP Unit.
Ten „BAEE Units“ are approx. 3,3 USP Units.

Application: pH optimum 7,2-8,5.

Trypsin inhibitor

≥10000 BAEE U/mg

Made from soybeans. High-activity inhibitor of trypsin, chymotrypsin, and other proteolytic enzymes.

Storage temp.: +4 °C

Danger H317-H334

Trypsin inhibitor inhibits Trypsin with high effiency, and, to a lesser extent, chymotrypsin. Additionally, there is a light inhibiting effect on plasmin, kallikrein, thrombin and a few other proteolytic enzymes.
1 mg of lyophilisate inhibits at minimum 10.000 BAEE Units of trypsin.
Application in cell culture (stock solution 1 mg/ml): Following trypsination, add the same volume inhibitor solution as was used for trypsin. Zentrifuge cells (5 mins, 1000 rpm), and remove supernatant. Resuspend cells in medium and cultivate further.

Application:
Stock solution: 1-10 mg/ml in H_2O, PBS or other phosphate-buffers.
Solutions of higher concentration may be hazy and slightly yellow-coloured.
Storage of stock solution: in aliquots at -20 °C.
Recommended end concentration: 1-100 µg/ml.
pH optimum: pH 7.6 - 8.0.

Cell Isolation

Ficoll® 400

for molecular biology and biochemistry

For density gradient centrifugation; ingredient of gel loading buffers.
Non-ionic polymer of saccharose.

M ~400 000 g/mol

Ficoll® 400 is a hydrophilic copolymer of saccharose and epichlorohydrin, that readily solubilises in water and aqueous solutions. It may be solubilised at concentrations of up to 50 %, and is mainly used in the following applications:
A) In hybridisation buffer acc. to Denhardt, Ficoll® 400 reduces non specific binding of labelled DNA to the filter membrane.
B) In gel loading buffer it supports DNA application to agarose gels by increasing the density of the sample.
C) In continuous or discontinuous density gradients, Ficoll® 400 is used as matrix for fractioning of cells (e.g. lymphocytes) or sub-cellular particles, also taking advantage of its ability to stabilise membrane-coupled components and the functional as well as the morphological integrity of cells.
Autoclavable at neutral pH.

Polysucrose 400

BioScience-Grade, for molecular biology and biochemistry

For density gradient centrifugation during cell separation and isolation of cell organelles.

Sucrose polymer, Sucrose-epichlorhydrin copolymer

$(C_{12}H_{22}O_{11})_n$ x $(C_3H_5ClO)_n$

M 450000 ±100000 g/mol

Storage temp.: +20 °C

Nonionic, synthetic copolymer from sucrose and epichlorohydrin. Ficoll® derivative. Solution of polysucrose 400 is used for separation of blood cells (mono nuclear cells, granulocytes, erythrocytes) via density gradient centrifugation, and for isolation of mononuclear cells from whole blood. Also well applicable for isolation of islets of Langerhans from pancreatic issue.
May be used as direct replacement for Ficoll® in common protocols.

Roti®fair BSC

for cell biology

Buffer solution for isolation of blood cells.

BSC buffer powder (pouch), Buffered Sodium Citrate

Exactly pre-weighed pouches for convenient and rapid preparation of BSC solution.
Prepared solution may be sterilized by filtration (0,22 µm).
For long-term storage, buffer solution should be kept at +4 °C.
0,109 M BSC solution is prepared by dissolution of 1 pouch in 100 ml or 1000 ml highly pure water, respectively.

Formulation:

Prepared BSC solution contains: 0,109 M (3,2 %) buffered Na-citrate, when prepared in deionized or distilled water.

For research use only. Not approved for human or veterinary use, for application to humans or animals, or for use in clinical or *in vitro* diagnostics.

Roti®-Sep 1077 human

ready-to-use S

CELLPURE® sterile, for density gradient centrifugation

Polysucrose based medium for separation of lymphocytes from whole blood.

Polysucrose solution, lymphocyte separation medium

M ~400000 g/mol

Storage temp.: +4 °C

Danger H317-H334

Ready-to-use and sterile. Separation medium based on polysucrose 400, for efficient isolation of lymphocytes by density gradient centrifugation. Density 1.077 g/ml. Best alternative to Ficoll®.

- Produces distinct, compact layers
- Results in high recovery rates of viable cells
- Maintains the representative ratio of B- to T lymphocytes
- May be directly applied to all protocols using Ficoll®

Roti®-Sep 1077 human excels due to the superior separation power, forming very distinct, easy to pipet, lymphocyte layers during centrifugation. The ready to use solution is very easy in handling, resulting in high cell recovery rates, while cell viability and the representative ration of B- to T lymphocytes are maintained. Osmolality as well as pH value are strictly kept in the physio-logical range.
Suitable for application with human peripheral blood. In all respective protocols originally using Ficoll® this reagent may be replaced by Roti®-Sep 1077 human without any adjustment.

The **figure** (to the right side) depicts two specimens prepared with heparinic blood obtained from venous puncture. Density gradient centrifugation of 6 ml diluted whole blood (dilution in PBS 1:1.5), with 3 ml of Roti®-Sep 1077 human, 10 mins., 1000 g, no break.
Recommended long-term storage at approx. 4 °C. Short-term storage at ambient temperature possible. Store protected from light.

DEAE Dextran

for biochemistry

Transfection reagent
Diethylaminoethyldextran
M ~500000 g/mol

DEAE is the oldest transfection reagent known. The method of complexation of plasmid DNA with diethylaminoethyldextran has been published in 1968 by McCutchan. Positively charged DEAE binds negatively charged DNA to aggregates, which then bind to negtively charged surface structures of cell membranes. Uptake is done via endocytosis. This DEAE method needs only little amounts of DNA, while resulting in high transfection efficiency of up to 30 %. However, the cytotoxic effects caused by DEAE allow only transient transfections. The following cell lines are well transfectable: CV-1, BSC-1 and COS cells, and other stabile, insensitive cell lines.
Stock solution: 50 mg/ml in H_2O. Autoclave.
End concentration: 1 mg/ml (transfection for 30-90 min.) or 250 µg/ml (transfection for up to 8 h)

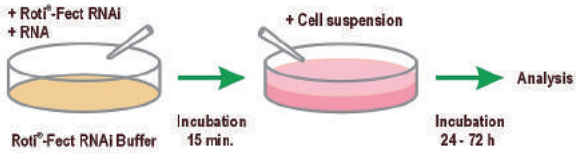
Roti®-Fect RNAi Kit ready-to-use



for transfection, CELLPURE®

Reagent for transfection of mammalian cells with siRNA and miRNA, for efficient gene silencing.
Storage temp.: -20 °C • Transport temp.: room temp.

- Optimised RNA release into the cytosol
- High levels of gene silencing with low RNA concentration
- Efficient knockdown after 48 hours already
- No elaborate optimisation necessary
- Very low cell toxicity
- Suitable for cell lines and primary cells
- Straightforward, efficient protocol for whole medium included

New, powerful transfection reagent for liposoma mediated siRNA and miRNA transfection of all mammalian cells in culture. Liposoma formulation and enclosed buffer were specially established and designed for core parameters of RNAi: Most efficient quantitative endocytosis plus release of nucleic acids into the cytosol, without subsequent transport to the nucleus. Roti®-Fect RNAi provides you with superior knockdown results, even using low amounts of RNA.
Hereby, the Roti®-Fect technology guarantees minimisation of toxic effects during transfection, thus making these reagents suitable for very sensitive cell lines of primary cells. The detailed instruction-for-use contains a standardised transfection protocol working via a definite RNA/liposoma ratio and providing good results starting with the very first assay - making elaborate optimisations of transfection obsolete. Evaluation of results is often possible after 48 hours, enabling two sequential assays per week.

Successfully tested with the following cell types:
Primary cells: MCS, M1
Cell lines: A549, 3T3-L1, B16F10, CHO-K1, H441, HT1080, HeLa, HeLa-KB, HepG2

The set contains:
0.2 and 1 ml, respectively, Roti®-Fect RNAi liposoma formulation (Art. No. 2911, may not be bought separately), and 0.4 and 2 ml, respectively, Roti®-Fect RNAi buffer (Art. No. 2913). Roti®-Fect RNAi buffer may be bought separately.

Approx. 250 assays per ml in 24wells. Dependend on the cell line used.

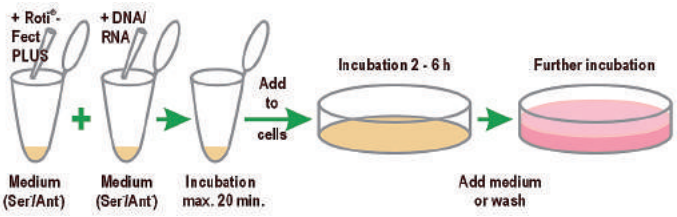
Roti®-Fect Plus ready-to-use

for transfection, CELLPURE®



Reagent for transfection of all eukaryotic cells in culture, particularly suited for hard-to-transfect cell lines.

Storage temp.: +4 °C

- Particularly low cell toxicity
- Superior transfection efficiency with all cell lines
- Especially recommended for hard-to-transfect cell lines
- Particularly suited for use with primary cells
- Excellent reproducibility
- No serum inhibition

Highly sophisticated transfection reagent for liposoma mediated transfection of eukaryotic cell lines and primary cells in culture. Roti®-Fect PLUS further reduces the toxic effects of transfection, making it a versatile tool for transfection of sensitive cell lines or primary cells.
Based on this, Roti®-Fect PLUS is also especially recommended for transfection prior to *in vivo* analyses (siRNA-Assays, *in vivo* life microscopy, etc.), since the transfection stress is minimized, reducing stress-dependent effects like the rate of apoptosis-induced cells. Additionally, the stability of nucleic acid/lipid complexes is diminished in comparison with Roti®-Fect, therefore improving the release of nucleic acids in the cell.
Thus, the newly established liposoma formulation of Roti®-Fect PLUS guarantees gentle and highly efficient transfections, even when hard-to-transfect or particularly sensitive cell lines are handled.

Successfully tested with the following cell types:
siRNA: 1BR3, HEK293, HeLa, LN-308, T98G. U87MG, UACC-257
Primary cells: 1BR3, 8VM, CGN, HMEC, HUVEC, PBMC, S15VM

Storage temp.: +4 °C

- Highly efficient reproduction of DNA in mammal cells
- Excellent reproducibility
- High and wide operating plateau
- No inhibition through serum
- Low cell toxicity
- Successful with different cell lines
- Excellent transfection results

Roti®-Fect is a liposome formulation of a polycationic lipid in combination with a neutral colipid. Compared to monocationic lipid formulations, Roti®-Fect has a higher efficiency with lower levels being required.
Its excellent reproducibility in combination with its high level of efficiency reduced optimisation work to a minimum. Because of its low toxicity, a wide range of cell lines can be transfected efficiently. An efficient triple-cotransfection using Roti®-Fect is described in Ufartes, Schlüter, Kaulfuss and Seipp (2005) *Biospektrum* 4: 464-5.

Successfully tested with the following cell types:

Roti®-Insectofect ready-to-use
for transfection, CELLPURE®

For transfection of insect cells in culture.
Storage temp.: +4 °C

- No serum inhibition
- Superior transfection efficiency
- High and wide operating plateau
- Excellent reproducibility
- Very low cell toxicity
- Quick and easy handling

Recombinant proteins at a large scale can be manufactured under simple conditions in insect cell cultures with the non-human pathogenic baculovirus system and a simple scale-up procedure. Roti®-Insectofect enables best transfection results with a wide spectrum of activity and very low toxicity.
Roti®-Insectofect consists of an aqueous solution of polycationic lipids and was specially developed for liposome-mediated transfection of insect cells. Because of its special formulation, it has a much higher efficiency than standard transfectants, such as calcium-phosphate or DEAE.

Successfully tested with the following cell types:
Ag55, Anso, As43, Bm5, Cpp512, IPLB-SF21, LD652, Mos-20, S2, SF9, SL2.

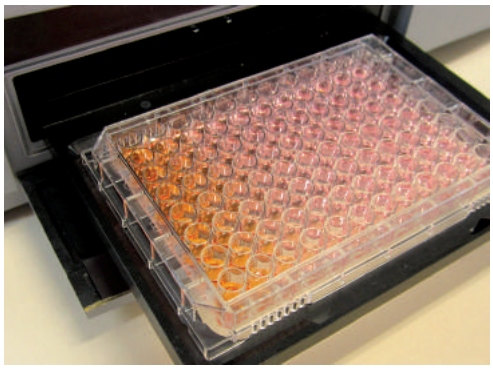
Rotitest® Vital ready-to-use S

Rotitest® Bio Analysis



Colorimetric test solution for evaluation of cell proliferation and -viability.
Non-cytotoxic cell proliferation test solution.
Storage temp.: +4 °C

- **Perfectly supersedes MTT**
- Cells keep on being vital
- Most simple handling
- One-component-system without radioactivity
- For adherent and suspension cells
- Photometric result in 1 to 4 hours
- Strong correlation between absorbance and cell number
- Suitable for every culture media

Rapid and simple test system for non-radioactive quantitation of proliferating cells. Also well suitable for cytotoxicity assays.
In all living cells, NADH and NADPH are formed by the respiratory chain. Roti®-Test vital is based on the (colourless) WST-8, which functions as acceptor for the NADH/NADPH dehydrogenase while being reduced to (coloured) formazane during the process.
The test solution is added directly to the cultivated cells in 96wells. During incubation for few hours, a water-soluble formazan dye is produced by viable cells, and is released into the surrounding medium. The resulting orange colour is measured photometrically (approx. 450 nm). Also suitable for culture media containing phenol red.

Sensitivity of the tetrazolium salt used is higher than that known for standard reagents such as MTT, XTT, MTS, or WST-1. Results were shown to be of highly stringent correlation with [^{3}H]-thymidine incorporation assays, therefore representing viability as well as proliferation status of the cells (Tominaga *et al.*, *Anal. Commun.* 1999 (36) 47-50).

Example of use.

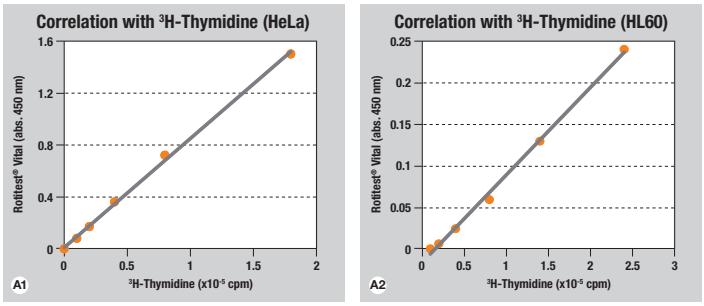


Fig. A: Correlation of cell counting results achieved with Rotitest® Vital (10 µl/well) and ^{3}H-Thymidine (37 KBq/well). HeLa (1, in DMEM) and HL60 cells (2, in MEM).

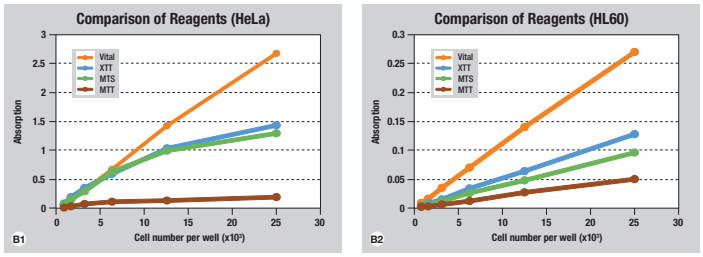

Fig. B: Comparison of cell counting results using Rotitest® Vital (10 µl/well) and other cell counting reagents. Photometrical measurement at 450 nm (Rotitest® Vital, XTT), 490 nm (MTS), and 570 nm (MTT).

Proliferation Assays

Our ROTI®Kits for EdU mediated detection of cell proliferation provide a superior alternative to time-consuming and less sensitive bromodeoxyuridine (BrdU) assays. Similar to BrdU assays, our assays utilise a uracil derivative (in this case ethynyldeoxyuridine, EdU) which is incorporated into the replicating DNA. EdU is not detected via antibodies; instead fluorescent dyes are coupled directly via click reaction. This fast and elegant approach allows for direct labelling of replicating DNA with the desired fluorescent dye. Thus, the assay is perfectly adaptable to the present facilities and to the assay situation (e.g. for double or triple detection). Furthermore, the click reaction is highly selective and therefore prevents any unspecific labelling. The protocol includes only few steps and decreases the total amount of time.

- Highly reliable
- Easy to perform
- Fast detection procedure (only 30 min)
- Mild conditions (no DNA denaturation required)
- Modular system due to click chemistry
- Compatible with various dyes and readouts
- Compatible with multiplexing
- No cytotoxicity up to 1 mM EdU

Roti®fair PBS 7.4

for biochemistry and molecular biology

General solution for assays in molecular biology and biochemistry.

PBS (tablet), Phosphate buffered saline

Exactly pre-weighed tablets for convenient and rapid preparation of PBS solution.
Among biological buffers, PBS is the one most commonly used. Due to its isotonic and non-toxic nature, PBS is suitable for applications in cell culture as well as in biochemistry and molecular biology. PBS is frequently used for sample dilution and as base solution in immunochemical processes.
Prepared solution may be sterilized by filtration (0,22 µm) or autoclaving.
For long-term storage, buffer solution should be kept at +4 °C.

Rapid and simple detection system of apoptotic cells, with simultaneous differentiation of necrotic cells.
During the first stages of apoptosis, phosphatidylserine (PS) is translocated from the inner membran layer to the outer surface of the cell.
The Rotitest®-Annexin V Kit uses the Ca^{2+} dependent binding efficiency of Annexin V to PS in order to label cells with damaged cell membranes.
Additionally, propidium iodide is used to counter stain nuclei of cells with opened membranes, hence those which undergo necrotic degradation.
Thus, cells with yellow-green membrane staining only can be identified as apoptotic, while double stained cells (with yellow-green membranes plus orange-red nuclei) are classified as necrotic.
Analysis is performed via flow cytometry or fluorescence microscopy.
Each package contains simple-to-follow instructions-for-use.

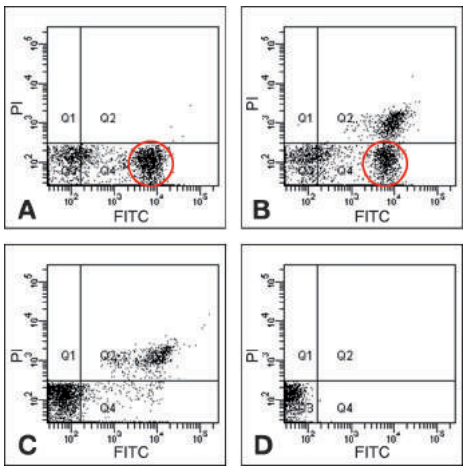

Figure 1:
Flow cytometry analysis of Jurkat cells. Assayed using 5x10^5 cells in 500 µl Annexin binding buffer, 25 µl Annexin V-FITC conjugate and 25 µl propidium iodide solution, 15 min. RT.
FITC-A: FITC staining (binding of Annexin-FITC conjugate),
PE-A: Propidium iodide staining
A,B) Cells after induction of apoptosis by Staurosporin, under pure annexin-FITC staining (A) or under annexin-FITC / PI staining (B), respectively. C,D) Uninduced control cells under annexin-FITC / PI staining (C) and without staining (D), respectively.
Due to the binding of Annexin V to PS on the outer membrane surface, apoptotic cells are Annexin-FITC positive, but PI negative (Q4, circle).
Q3 displays healthy cells (neg/neg), Q2 necrotic cells (Annexin-FITC pos and PI pos). Cells in Q1 (PI pos/ Annexin-FITC neg) are dead, non-apoptotic cells.

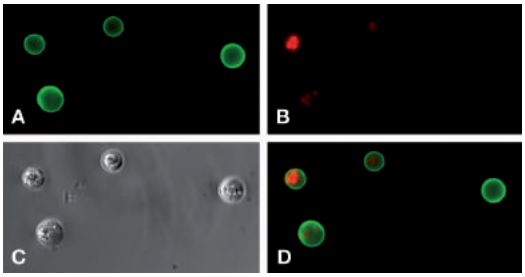

Figure 2:
Fluorescence microscopic analysis of Jurkat cells following induction of apoptosis by staurosporine. Assayed using 10^5 cells in 100 µl Annexin binding buffer, 5 µl Annexin V-FITC conjugate and 5 µl propidium iodide solution, 15 min. RT.
A) FITC fluorescence (green), B) propidium iodide fluorescence (red), C) bright field image, D) composite image. Apoptotic cells are FITC positive, PI negative. FITC pos/PI pos cells may be classified as being necrotic. Healthy cells are FITC/PI neg.

The kit contains:
Annexin V-FITC conjugate, propidium iodide solution, Annexin V binding buffer, detailed instructions-for-use.
Excluding the columns, contents of this Kit may not be bought separately.
Store at +4 °C protected from light. Do not freeze.

Roti®-Stock 10x PBS ready-to-use S

BioScience-Grade, ready-to-use, filtered and steam sterilised

For protein biochemistry, cytology, and molecular biology.

PBS 10x ready-to-use solution

10fold stock solution phosphate buffered saline. Very versatile standard solution for detection systems in protein biochemistry, cytological stainings and molecular biological assays. Thus, 1 x PBS is used as basic solution for Western-Blot analyses, ELISAs and other enzymatic assays, for solving and dilution of proteins, for immunocytological and immunohistological assays, as well as for *in situ* hybridisations, apoptosis detection systems and staining of nuclei.
Recommended for HRP-mediated detection systems.
With original seal.

Composition:
1.37 M NaCl, 27 mM KCl, 100 mM Na_2HPO_4, 20 mM KH_2PO_4 in deionised water, pH-value 7.4, 0.2 µm filtered and steam sterilised

Fixation

Fixation is used to stabilise cell shape and intracellular structures. The existing state at a defined time is thus preserved and can be proven in later analysis assays.

In cell biology, a buffered formaldehyde solution with a 4% or 4.5% concentration is mainly used for this purpose.Formaldehyde as an aqueous solution usually occurs as a diol (OH-HCH-OH), but polymerises readily ($OH-(H_2CO)_nH$) resulting in the formation of solids, which in turn are called 'paraformaldehyde'. For the **fixation** of tissue and cells, however, the formalin must be a monomer; in order to prevent polymerisation, the solution is therefore stabilised with methanol. To further prevent oxidation into formic acid, as occurs under atmospheric oxygen, formaldehyde solution is buffered with calcium carbonate or phosphate. On our high-quality **Roti®-Histofix solutions,** you will therefore find the entry **'acid-free, phosphate-buffered, stabilised with methanol'.**

According to GHS, concentrated formaldehyde solution is rated highly as poisonous, corrosive and hazardous to health, with the result that many users search for non-hazardous alternatives. This can be remedied by the use of bottled formalin solutions such as our **Roti®-Histofix in sample containers** or the new generation of **formalin-free fixation solutions,** such as our **Roti®-Histofix ECO plus.**

Roti®-Histofix ECO Plus

ready-to-use

Fixing agent without formalin

For fixing of histological and immunochemical specimens.
Formalin substitute.

Storage temp.: +20 °C

- Formaldehyde-free, non-toxic fixative
- Good fixation properties
- pH 4,5 -5,0
- No denaturing effect, e.g. shrinkage or crosslinking
- Adequate substitute for formaldehyde

Roti®-Histofix ECO Plus is a ready-to-use, aqueous solution on base of hexamethylene tetramine. The solution has as similar good fixation properties as formaldehyde, but is, unlike formaldehyde, classified as non-toxic. The original morphology of the tissue is preserved during the fixation process. The protein molecules are cross-linked in a reversible way, their structures are preserved. That is especially important for antigen-antibody reactions. Samples are - in contrary to other fixative media - free of artefacts such as shrinkage of tissue or irreversible protein crosslinking. The solution is therefore ideal for immunohistochemistry. All conventional staining processes can be carried out following fixation.
Roti®-Histofix ECO Plus is scented for better identification (< 1ppm).

Formaldehyde, chem. methanal (methane-aldehyde).
Derived from the Latin **formica** = ant, as formic acid occurs during oxidation of the methanal.
Formaldehyde in itself is gaseous at room temperature and is called formalin when it occurs as an aqueous solution.

According to current knowledge, **fixation** occurs through the formation of methylene bridges and bridges through Schiff bases and, since it is non-denaturing, is at least partly reversible through heating and/or alkalisation. The penetration velocity of formalin into tissue is approximately 1 mm/h.

Roti®-Free Slide Enhancer

RNAse-/DNAse-free

10x conc., BioScience-Grade

Concentrated buffer for enhancement
of detection signals in immunohistochemistry and *in situ* hybridization.

Storage temp.: +20 °C

- Very effective
- Gentle
- Odour-free
- Simple application
- Suitable for formaline- and paraffin fixed samples and cryo sections

Efficient stripping buffer for removal of antibodies, probes, and corresponding stains from immunohisto- and -cytochemical samples, as well as from *in situ* hybridizations. Due to the particularly adjusted formulation of the Roti®-Free Slide Stripping Buffer, antigens and hybridization partners are retrieved very gently, but quantitatively, enabling the samples to be assayed repeatedly. Suitable for all common samples like formaline- and paraffin fixed tissue and cells, or cryo sections.

Applications: The slides are incubated in Roti®-Free Slide Stripping Buffer for 20-40 min at 70-95 °C. After repeated washing steps, the samples may be assayed again with antibodies or probes. The particular parameters necessary for complete stripping depend on the respective samples, fixing-, and detection systems.

Blocking

Roti®-ImmunoBlock ready-to-use

ready-to-use, 10x conc.

Protein free blocking reagent for immunocytological assays.
Without detergent.
Storage temp.: +20 °C

Suitable for
- Immunocytological assays
- Immunohistological assays
- Paraffin- and cryosections
- *in situ* hybridisation
- Cell culture samples
- Whole mount samples

Roti®-ImmunoBlock is an innovative blocking reagent on a polymer base without detergents and proteins.

No contamination of your detection system through foreign proteins, reducing background and false-positive signals. Specific binding signals are preserved whilst non-specific interaction is impeded, increasing the signal-to-noise ratio. Ready-to-use solution for fast and easy applications.

Albumin, IgG free

>98 %, IgG-free, for biochemistry and molecular biology

Recommended as blocking and stabilisingreagent in all antibody-mediated detection systems.
BSA
M ~66 000 g/mol
Storage temp.: +4 °C

DNAse-/RNAse-/Protease-free

Albumin, highly purified and tested for presence of immunoglobulins (IgGs), proteases, RNAse, and DNAse. Albumin, IgG-free is particularly recommended for use as stabilising reagent in antibody solutions, and as blocking reagent in all assays using detection systems via antibodies. Also very well suited for stabilising of hot-start-PCRs mediated by antibodies, or as blocking reagent in antibody-detected hybridisations.

Demoslides Fluoro-4C

Reference sample for fluorescent microscopy

Glass slide with ready-to-use cell specimen.
For fine tuning of fluorescent microscopes.
Fluorescent preparation Fluoro-4C
Storage temp.: +4 °C

Durable test preparation of neuronal cells of a murine cell culture. Contains the markers Tubulin-Cy2, Nestin-Cy3 and DCX-Cy5 and in addition DAPI-stained nuclei. The specimens show 3D-structuresin form of cell aggregates (spherules) and a network of planar cells. There is an intracellular co-localization between Tubulin-Cy2 and DCX-Cy5.

Demoslide Fluoro-4C scanned by a 20x objective lens (100 µm) and a 63x objective lens (20 µm) of a laser scanning microscope (marker: Tubulin-Cy2-green; Nestin-Cy3-red; DCX-Cy5-magenta; DAPI-blue).

3 fluorescent channels and DAPI

The specimen contains stained cell structures in three different spectra: green (Cy2), red (Cy3) and infrared (Cy5). All three channels can be illustrated isolated or superposed. DAPI staining of nuclei allows identification of single cells as well as apoptotic or mitotic nuclei (fig. C). If Cy5-signals of DCX are displayed in red co-localization with Tubulin (Cy2-green) becomes visible as yellow signal (fig. A).

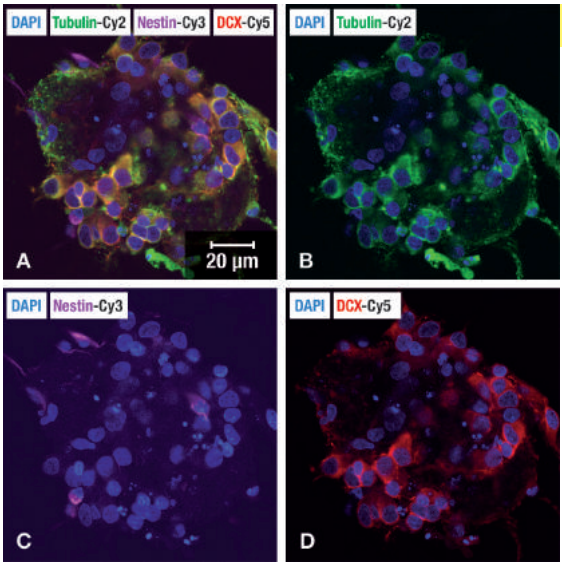

Illustration of the 3 fluorescent channels of Tubulin-Cy2 (B), Nestin-Cy3 (C) and DCX-Cy5 (D), each in combination with DAPI. Figure A shows the combination of all 3 channels. Objective lens: 63x; bar: 20µm

Packaging and Storage

Every Fluoro-4C preparation is mounted on a slide and covered with a cover slip for long-term storing. It is delivered in a preparation board. Please store the slides in the dark. Storage at room temperature is sufficient. However, for longer periods without usage we recommend usual slide boxes stored in the refrigerator. Allow the boxes to achieve room temperature before opening and removing the slides and avoid frequent temperature changes.

Avoid too long and too intensive exposure to UV light!

Hygiene Monitoring

In recent years, the prevention of infection, environmental-, residential- and communal hygiene have become very important even in day-to-day life. Today, hygiene monitoring equipment is installed, required and, in some cases, already prescribed by law in institutions, facilities and a variety of other areas. These include hospitals, rehabilitation clinics, ambulance services, blood donor services, drinking water supply systems, public swimming baths, sports facilities, schools, public offices, companies, hotels, gastronomy and canteens, food retailing, food-producing companies and ports.

The main emphasis of hygiene monitoring is on checking the results of cleaning and decontamination processes, e.g. in-house monitoring of food production and processing, determining the hygiene status of kitchens, sports facilities and sanitary facilities, checking the contamination status of air conditioning systems for the protection of employees and customers, and raising awareness of hygiene problems during training.

Roth offers a wide range of hygiene monitoring products which are quick and easy to use even for novices.

- Easy and safe handling - also for laymen
- Simple interpretation
- Storage and transport at room temperature
- Suitable for hygiene monitoring and contamination survey wherever needed, for schooling and student's courses

Rotitest® Protein

ready-to-use

Rotitest® Bio Analysis

Protein detection system for rapid control of surfaces after the cleaning process.

Protein quick test

Storage temp.: +20 °C

Warning H226

- Most simple handling
- Result in 2 mins. maximum
- Definite interpretation through colour shift
- Well suitable for laymen

Rapid and simple test system for detection of protein contamination on surfaces. Optimal for hygiene control and testing of cleaning efficiency of table tops, sales counters, handles etc.
This Rotitest® Protein is very easy to apply: Using the integrated swab the respective surface is probed; pressing of the lid automatically drips the detection solution onto the swab head. Interpretation is simple due to the distinct colour shift from yellow-orange to dark green-blue. Results are available in 2 mins. maximum.

Each package contains simple-to-follow instructions-for-use.

Store at 15-25 °C protected from light. Do not freeze.
Suitable for testing of any surface.

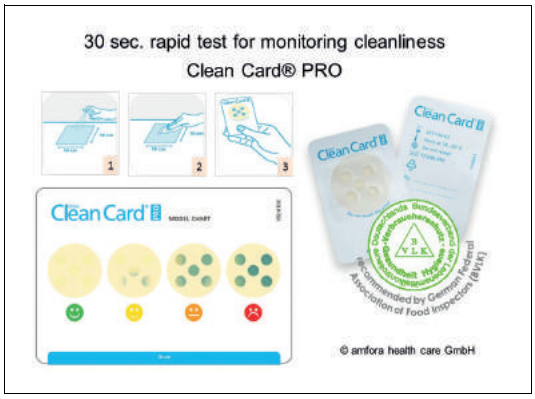
Orion Clean Card® PRO – Makes cleanliness visible



The Clean Card® PRO of amfora health care detects any soiling that contains protein or substances similar to protein, such as allergen proteins as well as surfactants from residual cleaning detergent or disinfectant agent on work surfaces, equipment and containers that look clean to the naked eye.This means cleaning practices can be quickly optimised and risks can be minimised – as outlined in the HACCP concept.

- **Fast** – results in 30 seconds
- **Straightforward** – clear analysis thanks to visible colour change
- **User-friendly** – no additional devices required
- Safety and high standard confirmed in internal tests for compliance with legal requirements of HACCP, good hygiene practice or internal QA/hygiene plans
- **Evidence from approx. 50 µg protein/100 cm²**
- Certified and proven in practice: Recommended by Bundesverband der Lebensmittelkontrolleure (German Association of Food Regulators)
- Suitable for use in many sectors, e.g. community catering, restaurants and cafés, hotels, cleaning services, food industry businesses, suppliers, haulage companies, for hygiene training courses to sensitise staff and for those working in hygiene, quality management and quality assurance, and much more.

ready-to-use

Storage temp.: +20 °C • Transport temp.: room temp.

The surface is wetted and then wiped with the Clean Card® PRO. After 30 seconds, the colour of the test section is compared against the colours in the picture card provided and the result is recorded.

A green or blue colour indicates the surface is contaminated with residual protein. The higher the level of protein detected, the darker the colouration of the card. The Clean Card® PRO test record (Art. No. 0076.1) can be used to maintain a clear overview of the results.

ATP Measurement with a System: Lumitester plus LuciPac®

Lumitester PD30

Made by Kikkoman
Easy-to-use, lightweight luminometer for ATP measurement. For reliable monitoring of liquids, dry and wet surfaces as part of hygiene control in the manufacturing sector, in the foodstuffs and animal feed sector, in patients- and health care, in gastronomy and trade, in training and in many other areas.

- Lightweight and easy-to-use
- Fast and easy handling
- Highly sensitive, precise measurement of ATP and AMP
- Ready for use after 8 seconds
- Auto-calibration
- Definition of own limit values is possible
- Data transfer via USB to computer
- Documentation and analysis software (Excel-based) included

NEW with Lumitester PD30:
- 8 language display options
- Data analysis software allows to match the testing mode to the particular measurement situation
- Stand-up soft case included as accessory

Technical specifications:

Measurement duration	10 seconds
Display	LCD
Calibration	Auto-calibration
Port	USB
Temperature range	5 to 40 °C
Measurement date	Internal date and time
Data output	RLU (Relative Light Units)
Data memory	2000 analyses
Power supply	2 x AA alkaline cells or 2 x nickel-metal hybrid batteries
Outer dimensions (W x H x L)	65 x 32 x 175 mm
Weight	235 g (excluding batteries)

Mechanism: Both ATP (adenosine triphosphate) and the more stable form AMP (adenosine monophosphate) are found in all living cells and, therefore, provide an exact and quantitative marker for the presence of bacteria, fungi or food residue. An enzyme/substrate complex in the LuciPac® Pen sampling tube reacts with both ATP *and* AMP to release bioluminescence whose intensity correlates directly with the quantity of ATP/AMP present. The Lumitester PD30 fully converts this bioluminescence into a measurement result and is, therefore, the most sensitive measuring system available today.

Thus, liquids and surfaces can be quickly and easily tested for contamination by foodstuffs and microorganisms using the Lumitester PD30 and the LuciPac® Pen sampling pen. Within approximately 30 seconds, the Lumitester PD30 can provide information on hygiene status or the efficiency of cleaning and disinfection procedures. The system is easy and safe to operate, even by non-professionals. Simply insert the sampling tube and close the unit. Then press the *Enter* button, and the measurement result will be displayed within 10 seconds.

Suitable for use with LuciPac® Pen Aqua (Art. No. NC58) for monitoring liquids and with LuciPac® Pen (Art. No. NC59) for the analysis of surfaces.

Hygiene (greek ὑγιεινή τέχνη [hygieiné téchne] = conducive to health [art])
The word "hygiene" is a collective term applied to all measures for the prevention of infectious diseases and the spread thereof as well as for the preservation of health.
Hygiene is often used incorrectly as a synonym for cleanliness, which, however, represents only a small part of hygiene. On the contrary, hygiene is the science of applying measures for the protection of health.

LuciPac® Pen ready-to-use S

Kikkoman for hygiene control

For testing for the contamination of surfaces by ATP/AMP measurement using Lumitester PD20 and PD30.

Storage temp.: +4 °C

For reliable monitoring of dry and wet surfaces in the manufacturing sector, in the foodstuffs and animal feed sector, in patients- and health care, in gastronomy and trade, in training and in many other areas.

- Quick and easy sampling
- Easy and quick measurement within seconds
- Sensitive and reproducible measurement

Using the LuciPac® Pen sampling pen, surfaces can be tested easily and quickly for contamination by bacteria, fungi and food residue. Organic contamination is indicated by the presence of ATP or AMP on these surfaces. An enzyme/substrate complex in the LuciPac® Pen sampling tube reacts with ATP and AMP to produce bioluminescence whose intensity correlates directly with the amount of ATP/AMP present. The Lumitester PD20 or PD30 then determines the bioluminescence as a direct measure of original contamination.
The unit is easy to operate, even by non-professionals. Just moisten the swab and swipe it across the surface. Then put the swab back into the tube and push it down into the reaction chamber. Shake the tube until the reagents are released and measure the bioluminescence in the Lumitester PD20 or PD30.

20 LuciPac® Pens each are packed in a resealable aluminium bag.
Store in a dark place.

LuciPac® Pen Aqua ready-to-use S

Kikkoman for hygiene control

For testing for the contamination of liquids by ATP/AMP measurement using Lumitester PD20 and PD30.

Storage temp.: +4 °C

For reliable monitoring of liquids, e.g. contamination control of water and wastewater.

- Quick and easy sampling
- Exact sample volumes of 150 µl
- Easy and quick measurement within seconds
- Sensitive and reproducible measurement

Using the LuciPac® Pen Aqua sampling pen, liquids can be tested quickly and easily for organic contamination. The organic contamination of liquids, e.g. by bacteria, is indicated by the presence of ATP or AMP in these samples. An enzyme/substrate complex in the LuciPac® Pen Aqua sampling tube reacts with ATP and AMP to produce bioluminescence whose intensity correlates directly with the amount of ATP/AMP present. The Lumitester PD20 or PD30 then determines the bioluminescence as a direct measure of original contamination. The sampling comb ensures precise sampling of 150 µl with a deviation of ≤2 %. Test results are, therefore, highly reproducible and comparable.
The unit is easy to operate, even by non-professionals. Just immerse the sampling comb into the liquid. Then put the comb back into the tube and push it down into the reaction chamber. Shake the tube until the reagents are released and measure the bioluminescence in the Lumitester PD20 or PD30.
20 LuciPac® Pens Aqua each are packed in a resealable aluminium bag.
Store in a dark place.

Lumitester LED Control Swab

Made by Kikkoman
The Lumitester LED control swab, once charged, produces a stable, exactly defined and calibrate light signal that can be used check the functioning of the Lumitester PD20 or PD30. The product illustration shows the LED control swab (back) in comparison with a LuciPac® Pen sampling tube.

Immediately before checking the Lumitester, connect the LED control swab to the power supply using the supplied charging cable and charge for 30 to 60 seconds. Then disconnect the LED control swab from the power supply and insert the LuciPac® Pen sampling tube into the cleaned measuring chamber of the Lumitester. The luminous energy emission is measured by pressing the *Enter* button.

Comparing the measurement result with the printed information indicates the condition of the unit. If the nominal value of 80 to 120 % is achieved, the Lumitester is in perfect working order. If not, please contact us to have the Lumitester and control swab recalibrated.

Monitoring of Pasteurised Milk

Rotitest® Phosphatase paper

ready-to-use

Rotitest® Bio Analysis

For detection of phosphatase in Milk.

Storage temp.: +4 °C

Test paper for efficiency monitoring of milk pasteurisation.
The test paper, impregnated with detection reagent, is cut at one end and allowed to soak by dipping it into a sample of the milk to be analysed. During incubation at 37 °C for 2 hours in maximum, a yellow colouring shows presence of Alkalic Phosphatase, hence the non-efficient pasteurisation of the milk.

Sensitivity of the phosphatase test system is 0.5 % raw milk in pasteurised milk. This test system does not provide quantitative data.
One package contains 10 single welded test papers, impregnated with detection reagent.

Rotitest® Listeria

ready-to-use S

Rotitest® Bio Analysis

Detection system for exclusion, or affirmation, of contamination by listeriae.
Storage temp.: +20 °C

- Most simple handling
- Definite interpretation through colour shift
- Well suitable for laymen

Simple test system for detection, or exclusion, of listeriae contamination on surfaces. Optimal for control and minimisation of the contamination risk caused by *Listeria ssp.*, particularly *L. monocytogenes*.
This Rotitest® Listeria is very easy to apply: Using the integrated swab the respective surface is probed and the swab is firmly pressed into the sterile nutrient medium. After incubation for 24-48 hours (37 °C) a distinct blackening of the medium indicates the presence of listeriae, hence the contamination of the respective surface.
Each package contains simple-to-follow instructions-for-use.
Note: This test system only allows exclusion, or affirmation, of a listeriae contamination per se. Quantitation is not possible.

ready-to-use S

Rotitest® Bio Analysis

Detection system for exclusion, or affirmation, of contamination by coliforms.
Storage temp.: +20 °C

- Most simple handling
- Definite interpretation through colour shift
- Well suitable for laymen

Simple test system for detection, or exclusion, of coliform contamination on surfaces. Optimal for hygiene monitoring and for minimisation of the contamination risk caused by coliforms in general., particularly *E. coli*.
This Rotitest® Coliform is very easy to apply: Using the integrated swab the respective surface is probed and the swab is firmly pressed into the sterile nutrient medium. After incubation for 18-24 hours (37 °C) a distinct colour shift of the medium from purple to yellow indicates the presence of coliforms, hence the contamination of the respective surface.
Each package contains simple-to-follow instructions-for-use.
Note: This test system only allows exclusion, or affirmation, of a coliform contamination per s1003e. Quantitation is not possible.

EC Blue System

For qualitative and quantitative detection of Coliforms, and *E. coli* in particular, in water.

- Fast - results in just 24 hours
- Simple - easy to handle, even by non-professionals
- Safe - easy-to-interpret colour reaction
- Sensitive - 1 cfu/100 ml detection limit
- Efficient - simultaneous analysis of coliforms and *E. coli*
- Also suitable for chlorinated and turbid water

Quick and safe process for the analysis of coliform bacteria in general, and *E. coli* specifically in water. The test is also suitable for analysis of turbid water samples and water samples containing suspended matter. Bacteria stressed by chlorinated water can generally also be verified.
The formation of a blue to blue-green colour after incubation at 35 °C indicates the presence of coliform bacteria in the water. This colour change is due to an enzymatic colour reaction of the coliform-specific galactosidase with the chromogenic substrate X-Gal.

The presence of *E. coli* can easily be detected by the occurrence of fluorescence under UV light (see EC-Blue Mini UV lamp Art. No. KK49.1). Approximately 95 % of all *E. coli* strains produce the enzyme ß-glucuronidase, which reacts with an enzyme substrate contained in EC Blue to release a fluorescent dye.

Quantification is possible using EC Blue Quant/MPN (Art. No. 0199.1).

The presence of *E. coli* can easily be detected by the occurrence of fluorescence under UV light. Approximately 95 % of all *E. coli* strains produce the enzyme ß-glucuronidase, which reacts with an enzyme substrate contained in EC Blue to release a fluorescent dye.

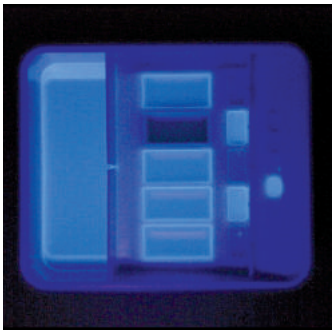
EC Blue Quant/MPN



By NISSUI
For fast and easy quantification of coliform bacteria according to MPN (Most Probable Number Method), e.g. according to DIN EN ISO 9308-2:2014-06. Optimised for use with EC Blue 100 and 100P.

- Reproducible, precise results
- Detection limit 1 cfu/100 ml
- No pre-dilution required
- Test result after 24 hours
- Simultaneous quantitation of coliforms and *E. coli*
- Also suitable for chlorinated and turbid water

The unique, innovative design of the EC BlueQuant/MPN allows rapid and reliable processing of MPN tests – simple to operate and without any additional equipment, except an incubator. The method is based on the standardised MPN method that uses at least three different dilution levels in increments of 10 and 5 compartments per dilution. Testing with the EC BlueQuant/MPN does not require a series of dilutions. When pouring the mixture, due to the special layout, the compartments are filled in such a way as to ensure correct serial dilution. After incubating the sample for 24 hours at about 35 °C, the result can be read off the device and converted to cfu/ml using ISO standard tables (e.g. DIN EN ISO 9308-2:2014-06).

Presence of *E. coli* can easily be detected by the occurrence of fluorescence under UV light (see EC-Blue Mini UV lamp Art. No. KK49.1). Approximately 95 % of all *E. coli* strains produce the enzyme ß-glucuronidase, which reacts with an enzyme substrate contained in EC Blue to release a fluorescent dye.

Detection limit: 1 cfu/100 ml for coliforms and *E. coli*.
The set consists of 18 EC Blue Quant/MPN chambers including lids.

Roti®-DipSlides

Sterile dip slides with solid, ready-made culture medium for easy microbiological analysis of solutions and surfaces.

- **2 in 1:** DipSlide and contact agar
- Very easy application
- Reliable assay and easy interpretation
- Suitable for determination of the microbiological status and for hygiene control in a variety of domains
- Detailed Instructions-for-use included

Tried-and-tested media in a new look – Now with optimized plastic carriers!

Roti®-DipSlides are made of a flexible plastic tongue which is coated with solid culture medium on both sides. Following dipping into the solution to be tested or inoculation by pressing to a surface, the slide is placed back into the sterile tube and incubated. Total area for analysis is 11,44 cm² per side. Ø tube 2,9 cm.

Please note: Larger quantities are produced freshly.
Hence, longer delivery times may occur.

Inactivation of anti-microbiological products:

Disinfectants and preservatives have the task of preventing the growth of, or killing bacteria. However, there are particularly resistant bacteria that can survive anti-microbe agents, or even survive in the active substance.
To determine the bacterial count, the bactericide or fungicide effect is neutralized by so-called uninhibitors. Thus, media containing uninhibitors can be used to check the effectiveness of the disinfectants and preservatives.

Important information on refrigerated transports

All products identified as being particularly temperature-sensitive are shipped in **special ice boxes with freezer packs or in dry ice.**
Additional costs resulting from such, **will be invoiced** (further information on request).

Please note:
In order to guarantee optimum product quality, the dispatch of refrigerated transport products will be carried out **on Mon and Tue only outside Germany!**
Slight delays in delivery are therefore possible.

Roti®-Aquatest Plates

Sterile culture medium plates for the microbiological analysis of liquid samples.

- Diameter 55 mm
- Surface 24 cm²
- Easy application
- Optimal for membrane filtration method
- Also applicable for the microbiological analysis of samples in general
- Prepared with our tried and tested dehydrated media mixtures
- Detailed instructions-for-use included

The germs of expected low-germ liquid samples are concentrated by membrane filtration. Afterwards, the membrane is placed on top of the medium and incubated.
Using a membrane with a grid helps counting the resulting colonies.

Samples which are expected to have a higher microbiological burden are prepared in a serial dilution. Afterwards, every dilution step is plated and incubated. The number of grown colonies is noted as result.
Please note: Larger quantities are produced freshly. Hence, longer delivery times may occur.

Compact Dry Ready-Made Plates

Dry ready-made plates for easy microbiological analysis of solutions and compact samples.

made by NISSUI

- Storage and transport at room temperature
- Simple and safe use
- Safely stackable
- Easy interpretation through chromogenic additives and 1 x 1 cm grid
- Detailed instructions-for-use included
- Suitable for control of foods and feeds, cosmetics and pharmaceutical samples, for hygiene monitoring and contamination survey, for schooling and student's courses

Compact Dry plates made by NISSUI are suitable for detection and enumeration of microorganisms from foods and feeds, cosmetics and pharmaceutical samples, as well as for hygiene monitoring and contamination control in food-producing areas. Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret.
Compact Dry plates are easy and safe to handle. Due to storage at room temperature, they may be used even on site. One millilitre of the sample to be analysed is applied onto the sterile plate surface, spreading itself evenly over the plate during rehydration of the medium. Dry sample matter is homogenised and solubilised using the Compact Dry Dilution Rack (Art. No. 4823.1) prior to plate inoculation.

Growth area is 20 cm^2. Inner Ø 47 mm.

Compact Dry CF

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for detection of coliforms.

Ready-made agar plate coliforms

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry CF plates is related to the Coliform chromogenic Agar and resembles a modified version of the Compact dry EC plates. The Chromogenic mixture has been replaced by X-Gal, causing all coliform bacteria to grow in colonies of a bright blue colour.

AOAC-, MicroVal-, and NordVal- certified.

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for detection of coliforms in general, particularly *E. coli*.

Ready-made agar plate *E. coli*

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry EC plates is related to the Coliform chromogenic Agar. Colonies of *E. coli* show a bright blue colour, while other coliforms grow in red to pink coloured colonies. Addition of red and blue colonies results in total count of coliforms.

AOAC-, MicroVal-, and NordVal- certified.

Compact Dry ETB

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for detection of enterobacteriaceae.

Ready-made agar plate enterobacteria

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry ETB plates is deduced from the Violet Red Bile Agar with Dextrose (VRBD). Enterobacteriaceae grow in red colonies.

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for total germ count.

Ready-made agar plate total count

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. Compact Dry TC are based on a standard total-germ-count agar under addition of TTC which, being a redox-indicator, stains all living bacterial colonies red.

Compact Dry SL

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for detection of salmonellae.

Ready-made agar plate salmonells

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry SL plates is deduced from the formulation of Triple Sugar Iron Agar. Salmonellae may easily be identified by the green colouring of the colonies, accompanied by colour shift of the plate to yellow due to alcalization of the medium. Salmonellae producing hydrogen sulphide grow in black colonies on yellow medium.

Ready-made plates with anhydrous chromogenic nutrient medium for detection of *Bacillus cereus.*

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry X-BC plates is based on a nutritious formulation, using mannitol as selective agent. Colonies of *Bacillus cereus* grow in a light blue or blue colour.

ready-to-use S

NISSUI for microbiology

Ready-made plates with anhydrous chromogenic nutrient medium for detection of yeasts and moulds.

Ready-made agar plate yeasts and moulds

Storage temp.: +20 °C

Due to the chromogenic additives, bacterial colonies depict specific colouring, making them easy to interpret. The nutrient medium used for Compact Dry YM plates is deduced from an enriched version of the Potato Extract Glucose Agar. While accompanying bacteria are inhibited by inherent antibiotics, yeast colonies show a bright blue colour. Due to the net quality of the plate matrix, moulds are able to form their natural, three-dimensional growth structure accompanied by their respective characteristic colouring.

Compact Dry Swab

ready-to-use S

NISSUI for microbiology

All-in-one set of swab and nutrient broth for microbiological sampling of surfaces.

Storage temp.: +20 °C

Sterile all-in-one system for sampling in the microbiological field of work. Suitable for analysis of foods and feeds, in pharmaceutical areas, as well as for hygiene monitoring, and for exclusion of contaminations.
Compact Dry Swabs made by NISSUI are particularly easy to apply, and may also be used by laymen. In order to test a surface, the respective area is wiped with the sterile cotton swab. After returning the swab into the tube, the germs are released into the nutrient broth by agitation. The amount of 1 ml medium has been optimised for inoculation of nutrient agar plates in general, also making this swab most compatible with Compact Dry plates.

Compact Dry Swabs are particularly suitable for sampling at difficult-to-access areas or when working on site. The sample taken may be transported inside the swab.
Storage at room temperature as well as easy application makes them a very versatile tool in microbiology.

Nutrient Media

Microbiological Nutrient Media

ROTH provides the most important microbiological nutrient media as ready-made mixtures. Our anhydrous media fulfil the highest purity and quality requirements, several media are formulated according to the specifications of the European Pharmakopoeia (Ph.Eur.), European and German drinking water regulations, APHA, and other ISO standards.
Our microbiological nutrient media are suitable for analysis of food, cosmetics, pharmaceutics, and research, as well as for service and waste water analysis.

„Infusion“

In the early days of bacteriology, so-called "infusions" (tissue extraction) were used in microbiological media. During the development of the dry media, these extracts were dried and used in a powdery form to produce purified and standardised extracts. Today, extracts or special, highly purified peptones are commonly used in modern media.

As simply manufactured and non-standardised natural products, "infusion" have a relatively low batch-to-batch constancy and vary both in composition and in nutrient content. However, they are still commonly used in several classic media.

Dichlorane Bengal Red Agar (with chloroamphenicol)

ISO 11133, ISO 21527-1, for microbiology

Selective agar for enumeration of yeast and food mould fungi, especially for strongly hyphen-forming fungi.

DRBC Agar

Storage temp.: +20 °C

The addition of dichlorane inhibits hyphae-forming fungi from spreading and improves counting. Chloroamphenicol and a low pH-value inhibit the growth of bacteria.

Microbiological Quality Control

Microbiological quality control of Roth molecular biological and microbiological culture media and agar is carried out according to following guidelines:

- Plating relevant bacterial strains from standardized stock solution (as a rule in dilutions of 10^{-1} to 10^{-10}) on agar plates of culture medium to be tested. The preparation of the media and agar must be carried out strictly according to the instructions, which are included.
- Plates from a checked batch of culture media are used as a reference
- The developed colonies are counted and rated after adequate incubation. Counting is always carried out using the plate with colony number 30-300.
- Standardization and validation of test: reference plates are compared with the number of bacteria expected
- Reference and test plate colonies are analysed for size, colour, appearance and possible reaction to certain chemicals
- Growth count on the test plates:

„good“ or „satisfactory“	colony number = 50 % - 99 % of expected growth
„moderate“	colony number = 30 % - 50 % of expected growth
„inhibited“	colony number ≤ 30 % of expected growth
„zero“	no growth

Light-coloured precipitates in nutrient media

In media containing potassium or sodium phosphate, large amounts of yeast extract,or non-fat milk, light-coloured precipitates may form during autoclaving, appearing as opaqueness, light-coloured clouding or white precipitate. In the majority of cases this is insoluble calcium- or magnesium phosphates, which originate in exceeding of the solubility product during heating, and which don't resolubilise during cooling. Typical media showing these phosphate crystals are, for instance, Terrific Broth (TB), Plate Count Agar with non-fat milk, or **Fraser media**.

The amount of phosphates present is only slightly reduced by that, so the medium may be used without any problems. In case the cloudiness hinders analyses, the bouillon may be cleared from precipitates by sterile filtration. Agar media may generally be used directly.

In cases of recurrence we recommend to thoroughly check the desalting plant, or to desalt the water used repeatedly, in order to remove residual calcium carbonate (chalk).

Sterilisation of media containing sugar

Media containing sugar or **malt extract**, particularly those with a low pH, must be sterilised with care. We recommend autoclaving at up to 118 °C for a maximum of 15 min. Please observe the guidelines given in the instructions for use.

The reasons are as follows:

a) Heating sugar in combination with amino acids (from peptone, meat extract, yeast extract, or similar) can result in **toxic Maillard reaction products** which may interfere with proliferation of micro-organisms.

b) Inclusion of different sugar molecules and sugar degradation products will cause premature chain termination and inhibit chain cross-linking. The **gelability of agars containing sugar** will thereby be reduced.

m-EI-chromogenic Agar (Base)

for microbiology

For detection and enumeration of *Enterococcus* in water via single step membrane filtration.

Storage temp.: +20 °C

Staining of species:
Enterococcus blue (by reaction of the β-D-glucosidase)
E. coli inhibited
Application: Use 71,95 g for 1 l agar. After autoclaving add 0,24 g nalidixic acid (Art. No. CN32.1) solubilised in water.

Formulation:

Yeast extract	30 g/l
Sodium chloride	15 g/l
Peptone	10 g/l
Esculin	1 g/l
Chromogene Mixture	0,75 g/l
Sodium azide	0,15 g/l

R2A-Agar

Ph.Eur., for microbiology

For enumeration of heterotrophic bacteria from water samples.

Agar medium S (Ph.Eur. 6.0), Reasoner's 2A Agar

Storage temp.: +20 °C

Nutritionally reduced medium. Incubation of water samples on R2A Agar often leads to higher colony numbers of micro organisms than found for rich media, particularly when incubation is performed at lower temperatures. The medium was originally developed by Reasoner and Geldreich to determine the total germ number in drinking water (Reasoner and Geldreich, 1985, *Appl. Environ. Microbiol.* 49:1).
Application: Use 18,1 g for 1 l agar.

Sabouraud 2 % Glucose Broth

Ph.Eur., for microbiology

Selective media for taxonomic analysis of pathogenic fungi.

Sabouraud Dextrose Broth (Ph.Eur. 6.3, 7.0, 8.0 and 9.0)

Storage temp.: +20 °C

Recommended by the Harmonized Method (Ph.Eur. 6.0, 2.6.13.B) for growth of *Candida albicans*.
The low amount of glucose supports the activation of the secondary metabolism and, subsequently, pigment formation.

Application: Use 30 g for 1 l broth.

Guarantee analysis:

Meat and casein peptone	10 g/l
Glucose	20 g/l
pH value	5,6 ±0,2

Microbiological Quality Control

Microbiological quality control of Roth molecular biological and microbiological culture media and agar is carried out according to following guidelines:

- Plating relevant bacterial strains from standardized stock solution (as a rule in dilutions of 10^{-1} to 10^{-10}) on agar plates of culture medium to be tested. The preparation of the media and agar must be carried out strictly according to the instructions, which are included.
- Plates from a checked batch of culture media are used as a reference
- The developed colonies are counted and rated after adequate incubation. Counting is always carried out using the plate with colony number 30-300.
- Standardization and validation of test: reference plates are compared with the number of bacteria expected
- Reference and test plate colonies are analysed for size, colour, appearance and possible reaction to certain chemicals
- Growth count on the test plates:

„good" or „satisfactory"	colony number = 50 % - 99 % of expected growth
„moderate"	colony number = 30 % - 50 % of expected growth
„inhibited"	colony number ≤ 30 % of expected growth
„zero"	no growth

Granulated Media for Microbiology

- **Easy:** high solubility
- **Safe:** dust minimised granules reduce health risk
- **Clean:** minimised contamination of workplace
- **Homogeneous:** reduced formation of lumps or separation of the components
- **Fast:** improved flowability for faster processing
- **Tried and tested:** formulation equals our powder media, without any further additives
- **All-round:** suitable for enviromental analysis, cosmetic-, food- and water-industry, and many more
- **Storage temp.:** +20 °C

Additives

Ammonium iron(III) citrate solution ready-to-use S

12,5 %, sterile, ready-to-use

Media supplement for detection of *Listeria monocytogenes*.

Storage temp.: +20 °C

Ammonium iron (III) citrate (ferric ammonium (III) citrate) is used as additive in nutrient media for detection of Listeria species. Hydrolysis of esculin by *Listeria* species results in 6,7-dihydroxycoumarin which reacts with ferric ions producing blackening of the medium. Additionally, ferric ammonium citrate has been shown to improve the growth of *Listeria monocytogenes* (Cowart and Foster (1985) *J. Infect. Dis.* 151:721).

Application: One vial ferric ammonium (III) citrate solution (0.25 g in 2 ml) is added to 500 ml autoclaved Fraser Broth (Art. No. HP17) or Fraser Half Broth (Art. No. HP18). Mix carefully and store cooled for 2 weeks in maximum. Fraser Broth is used in the rapid detection of Listeria from food and environmental samples (Fraser and Sperber (1988) *J. Food Protect.* 51:762).
One box of 10 vials Ammonium iron(III) citrate solution is sufficient for 10 x 500 ml Fraser Broth.

Egg Yolk Emulsion (20 %) S

ISO 7932, sterile, stabilised, for microbiology

Media supplement for preparation of egg yolk agar for detection of microbial lecithinase activity.

Storage temp.: +4 °C • Transport temp.: room temp.

Egg Yolk Emulsion is used as supplement in nutrient agars for detection of lecithinase activity in microbial colonies. Herewith, bacterial species like *Bacillus cereus* and *Clostridium perfringens*, or *Staphylococcus aureus* may be identified. The lecithinase activity can be noted by formation of light, sometimes whitish halos surrounding the colonies.

Application: The ISO 7932 recommends a final concentration of 10 % emulsion in the prepared medium in general, e.g. in Mannitol Egg Yolk Polymyxin Agar (Base) (Art. No. 5765.1) for examining the lecithinase activity of *Bacillus cereus*.

We recommend using TSC Agar (Base) (Art. No. CL51.1), Mannitol Salt Agar (Art. No. CL81.1) or Palcam Listeria Agar (Base) (Art. No. 5768.1) for base agar with the addition of 5 % emulsion.
Add after autoclaving.

Egg Yolk Tellurite Emulsion (20 %) S

ISO 6888, sterile, stabilised, for microbiology

Media supplement for preparation of egg yolk tellurite agar, for detection of *Staphylococcus aureus*.

Storage temp.: +4 °C • Transport temp.: room temp.

Egg Yolk Tellurite Emulsion is used as supplement in nutrient agars for detection of lecithinase activity and concurrent tellurite reduction in microbial colonies. Hence, *Staphylococcus aureus* may be identified by the dark grey to black staining of the colonies due to tellurite reduction, accompanied by lecithinase-caused formation of light, sometimes whitish halos surrounding the colonies.

We recommend using Baird Parker Agar (Base) (Art. No. X913.1) for base agar.
Application: The ISO 6888 recommends a final concentration of 5 % emulsion in the prepared medium.
Add after autoclaving.

Identification of Microorganisms

Testing Reagents

Kovacs' Reagent
for microbiology

Media supplement for detection of microbial indole.
Indole Reagent
Storage temp.: +4 °C

Danger H226-H290-H302-H315-H318-H335-H336

Tryptophanase-positive microorganisms (e.g. *E. coli, S. faecalis, Proteus sp.*) that cleave tryptophane hereby release indole, which may be detected by reaction with dimethylaminobenzaldehyde by forming a dark red dye. Microorganisms must be incubated in a glucose-free broth with high concentrations of tryptophane present.
Kovacs' Reagent is added to 24-48 h old cultures in a concentration of 0.2 to 0.5 ml per 5 ml broth. A colour shift to dark red shows presence of indole, thus confirming the inoculating colony as being indole-/tryptophanase-positive.

Application: Customary concentration in medium: 4-10 %
100 ml Kovacs' Reagent is sufficient for approx. 2 l medium.

Type analysis:

Appearance	yellowish, clear liquid
4-(Dimethylamino)benzaldehyde	50 g/l

Rotitest® Oxidase strips ready-to-use
Rotitest® Bio Analysis

Rapid test system for detection of cytochrome oxidase in microorganisms.
Storage temp.: +4 °C
Rapid test system for detection of oxidase-positive microorganisms.
A green coloured area indicates the reaction zone, impregnated with detection reagent, at one end of the paper strip. The colony to be analysed is smeared onto this reaction zone. Within 15 seconds, a dark-blue to violet colouring indicates presence of oxidase-positive microorganisms.

The following microorganisms are typically oxidase-positive: *Helicobacter pylori, Vibrio cholerae, Campylobacter jejuni, Legionella pneumophila, Neisseria, Moraxella*, many *Pseudomonaceae* and *Diplococci*.
Many *Enterobacteriaceae* are typically oxidase-negative.

Legionella Acid Buffer ready-to-use S
EN ISO 11731-2, sterile, ready-to-use for microbiology

Sterile acid buffer solution for detection of legionella.
0.2 M HCl/KCl Solution, pH 2.2, Acid buffer pH 2.2, HCl/KCl-Puffer
Storage temp.: +20 °C • Transport temp.: +20 °C
To minimize the accompanying bacterial flora, 30 ±5 ml of Legionella Acid Buffer are applied to the membrane after membrane filtration. After an exposure time of approx. 5 minutes, the buffer is vacuumed off and the membrane rinsed with sterile distilled water.
The filter is transferred sterile to a legionella selective agar, e.g. Legionella Agar (Base) (Art. No. CL48.1) and incubated.
Bottle with 50 ml graduation. With original seal.
The buffer should be used within 4 weeks after opening.

RiboFlow® Kits for biomolecular detection of germs

By SY-LAB
- Specificity comparable to PCR
- Short assay time (<30 min)
- Simple protocol
- No expensive instrumentation necessary
- Particularly convenient for testing foods, toiletries and cosmetics
- Storage temp.: room temp.

SY-LAB´s RiboFlow® Test Kits were especially developed for detection of relevant bacterial contamination on-site, based on molecular flow technology - quickly and highly specific, without the need for sophisticated sampling , complex amplification techniques and expensive equipment.
Replicating cells are reliably detected by their ribosomal RNA in less than 30 minutes.
RiboFlow® Salmonella and RiboFlow® Listeria Twin are validated according to ISO 16140-2:2016.

The test is easily performed with usual cultures in enrichment media or with single colonies from agar plates. The sample is just mixed with the included solutions and pipetted on the test cassette. As result, a distinctive and easy to read line occurs only in the presence of the target organism.
Every kit includes a detailed manual with Standard- and Quick reference protocols.

We recommend the usage of a small laboratory centrifuge with at least 2000 x g (e.g. Art. No. CX73.1), a mini incubator, optimally with window (e.g. Art. No. YC53.1) and a tray (e.g. Art. No. YH58.1, Measures: 26 x 20 x 2 cm) as accessories for the application of the kits.

For research use only. Not approved for human or veterinary use, for application to humans or animals, or for use in clinical or *in vitro* diagnostics.

* Within the RiboFlow® Listeria Twin Kit, one test cassette detects simultaneously the presence of *Listeria monocytogenes* and/or of other *Listeria spp*.

** The RiboFlow® Cosmetics Combi test Kit consists of 6 sets with 4 test cassettes each with whom the target organisms *Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus* and *Candida albicans* can be tested parallely.

*** Within the RiboFlow® P/En Kit, one test cassette detects simultaneously the presence of *Pseudomonas aeruginosa* and/or of enterobacteria.

Microbiological Staining

Microbiological staining is mostly applied for identification of microorganisms during microscopic analysis. Due to their affinity to certain cell structures, acidic dyes or salts of basic aniline dyes are used frequently for contrastation of cells, differential staining, or accentuation of specific structures (flagella, spores, or capsules).

For detailed information on the products please see chapters Histology/Staining and Chemicals A-Z.

Benefits of granulated Media:

- Dust minimized
- High solubility
- Without additives

LB Broth (Lennox), granulated

granulated, for molecular biology

Standard formulation used for propagation and culturing of *E. coli*. Low salt content for high-copy plasmid proliferation and preparation, as well as for phage propagation under supplementation with magnesium chloride. Granulated, dust-minimized version with high solubility and superior homogeneity.
Application: Use 20 g for 1 l broth.

Yeast-Nitrogen-Base (without Amino Acids)

for molecular biology

For yeast classification based on amino acid and carbohydrate requirements. **YNB Medium**

Yeast Nitrogen Base (without amino acids) contains ammonium sulphate, all vitamins and all organic salts needed to cultivate yeasts, **except for the amino acids and carbohydrate sources**. By selective addition of single amino acids and sugars the yeast cells are tested for sugar assimilation and for their dependency on specific amino acids, hereby revealing parameters for their classification.
Application: Add 6,7 g for 100 ml broth for 10x stock solution.
Use selected sugar/amino acid.
Do not boil, do not autoclave! Sterilise by sterile filtration!

Formulation:

Ammonium sulphate.	5,0 g/l
Potassium phosphate.	1,0 g/l

LB-Broth

LB-Broth is a standard medium for maintanance and propagation of *E. coli*. The LB-series of media (**L**uria and **B**ertani) includes several formulations, which differ mainly in their salt contents.

Typical LB-Broth formulations are: Luria, Luria-Bertani, LennoxL, LennoxLB, Luria/Miller. For plasmid propagation, salt concentrations between 5 and 10 g/l are recommended.

NZYM- and NZCYM Broth

These media were designed for the propagation of **bacteriophage Lambda**.
In order to encourage multi phage insertion into the host cell, supplementation with 0.2 % maltose is recommended (prepare a 20 % solution and add 1 ml per 100 ml of medium), which promotes expression of LamB (lambda receptor).

If maltose is added, the medium should not be used to create phage stocks, as binding of phage particles to membrane fragments will occur because of increased LamB density.

SOB Broth

for molecular biology

Enriched broth for propagation of *E. coli*, particularly suited for proliferation of competent cells after transformation. May be enriched to SOC-medium with 20 mM glucose.
Application: Use 26,64 g for 1 l broth.

Formulation:

Tryptone. ..... 20 g/l
Yeast extract. ..... 5 g/l
Magnesium chloride. ..... 0,96 g/l
Sodium chloride (NaCl). ..... 0,5 g/l

SOB

Super **O**ptimal **B**roth (SOB) is a complex, nutritious nutrient medium which is used prior to and after transformation of *E. coli* bacteria. By adding 20 mM glucose it is enriched to SOC (**S**uper **O**ptimal Broth with **C**atabolite repression) which is optimal for coddling up of freshly transformed bacteria. Through this, SOC increases transformation efficiency. In order to avoid caramelisation, glucose may only be added after autoclaving.

Terrific Broth modified

for molecular biology

Nutricious medium for the culture and proliferation of *E. coli*. Terrific Broth supports high cellular density and is recommended for use during cultivation of bacteria for plasmid isolation or *in vitro* protein expression.
In the formulation of Terrific Broth modified, the phosphate content has been reduced, in order to prevent precipitation of insoluble salts during autoclaving.
Application: Use 47,6 g for 1 l broth. Before autoclaving add 4 ml glycerol per litre medium.

Formulation:

Casein, enzymatically digested. ..... 12 g/l

Terrific Broth

Terrific Broth is a phosphate buffered, highly nutritious medium that is particularly used prior to plasmid isolation, in order to increase the yield. Compared with LB Broth, TB contains a nearly 5x elevated concentration of yeast extract, providing the required growth factors, vitamis and nucleotides. The phosphate buffer stabilises pH values. Hence, bacteria proliferate to high cell density, while lysation is slowed down.

The high phosphate concentration may lead to precipitation of insoluble magnesium- or calcium phosphates. After autoclaving, antibiotics, glycerine, dextrose etc. may be added for further enrichment of the broth.

Basic Reagents for Nutrient Media

High-quality compounds are vital for rapid growth and efficient selection of microorganisms. Peptones in particular are an easily accessible source of carbohydrates as well as nitrogen and amino acids. Yeast extracts additionally are very rich in vitamins, growth factors, and nucleic acids. The most common basic reagents for nutrient media have been assembled here.

Casein hydrolysate, bacteriological

for biochemistry, acidic hydrolysate

Casamino acids

Storage temp.: +20 °C

Manufactured by hydrolysation of casein by hydrochloric acid. Tryptophane-free. High-grade casein hydrolysate **with superior amino-nitrogen/total nitrogen ratio (AN/TN)**. Particularly suitable for sensitive assays and applications requiring high yields, like production of bacterial toxins or vaccines.

Type analysis:

In the early days of bacteriology, so-called **"infusions"** (tissue extraction) were used in microbiological media. As simply manufactured and non-standardised natural products, "infusion" have a relatively low batch-to-batch constancy and vary both in composition and in nutrient content. However, they are still commonly used in several classic media (Art. No. 7596).

Sterilisation of media containing sugar

Media containing sugar or **malt extract**, particularly those with a low pH, must be sterilised with care. We recommend autoclaving at up to 118 °C for a maximum of 15 min. Please observe the guidelines given in the instructions for use.

The reasons are as follows:

a) Heating sugar in combination with amino acids (from peptone, meat extract, yeast extract, or similar) can result in **toxic Maillard reaction products** which may interfere with proliferation of micro-organisms.

b) Inclusion of different sugar molecules and sugar degradation products will cause premature chain termination and inhibit chain cross-linking. The **gelability of agars containing sugar** will thereby be reduced.

The term **peptone** is used for all proteins digested by acid or enzymes. In addition, the source (e. g. 8986.1: Peptone ex Casein) and the digesting compound should be given (e. g. "tryptic"). Source of nitrogen and amino acids.

Tryptone is manufactured by digestion of casein with pancreas extract (pancreatic digest). Tryptone is rich in tryptophane, and an ideal source of nitrogen and amino acids used in a number of microbiological nutrient media (Art. No. 8952 and 6681).

NZamine also is manufactured by pancreatic digestion of casein. Being similar to tryptone it is often used as source of nitrogen and amino acids in nutrient media for bacterial growth in molecular biology (Art. No. CP76).

Proteose peptone is formed by hydrolytic cleavage of proteins from animal tissue, more complete that which occurs for peptones in general, but not strong enough to form single amino acids. Proteose peptone is rich for peptides with high molecular weight, beeing a high-grade component of microbiological nutrient media (Art. No. HP32).

Casamino acids originate from hydolysis of casein by acid. This compound is used as source of nitrogen and amino acids when completely hydrolysed protein is required, e. g. in proliferation assays or during production of vaccines and toxins (Art. No. AE41 and A157).

Agar types

The designation Agar **Kobe I** derives from the geographical origin of the agar, which is the Japanese city of Kobe on the main island of Honshu. In former times, when agar was still traded in strips, threads or squares, agar was graded into three main quality groups:

Kobe I - top quality, pure white
Korea I - slightly inferior quality, slightly yellowish to light beige
China - inferior quality, yellow-beige

These terms and the associated differences in quality are now obsolete - for some time now, agar of consistent quality has been available from all parts of Asia. However, for reasons unknown, the designation Kobe I is used today to describe ground agar of very high quality which is used as a microbiological standard agar.

BioScience Agar forms clear gels and is of high purity without any residues that could hinder growth of transformed - and therefore stressed - GMOs. Hence, it is particularly recommended for production of agar plates for bioengeneering. **BioScience Agar** is used as gelating agent in our *Anhydrous Nutrient Media for Molecular Biology*.

In addition, the designation **bacteriological agar** has become an established definition for ultra-pure agar, which represents a preliminary stage of purified agarose and is manufactured for special microbiological applications.

Danish agar, also known as Furcelleran, is a saccharide-enriched **carrageenan** extracted from the red algae *Furcellaria fastgiata*.

Please Note:

Being extracts from natural products, the properties (e.g. gelling behaviour, salt content) may vary from lot to lot. Further information on analysis data see Chemicals A-Z.

Instructions:

Culture-Plates: 15 g/l medium;

approx. 30-35 ml medium is required for a 90 mm culture plate.

Top-Agar: 7 g/l medium.

The solution should be autoclaved for 20 min and the preparation carefully swayed to distribute the agar evenly. Cool the agar down to 50 °C before adding the antibiotic. Sway the agar solution again before casting the plates.

Any air bubbles on the surface of the culture plates can be removed with a bunsen burner flame. Once the agar has hardened, the plates should be stored top-down at 4 °C.

Carrageenan, kappa

highly pure

Strongly gelling Carrageenan of kappa type. Forms gels of high gel strength. For gelling of watery liquids like e.g. culture media for plants or animals. Manufactured from cultured and controlled sea weeds.

Carrageenan E407

Carrageenans are agar-related hydrocolloids consisting of esters of galactose and anhydro-galactose polysaccarides. Kappa Carrageenan is obtained by alkaline extraction from red algae (*Rhodophyceae*) of the order *Gigartinales*, purified by filtration and recovered by KCl precipitation. In ionic solutions, heat-solubilized kappa Carrageenan self-assembles into helical structures and gels during cooling, the gel parameters depending on the ions present: Potassium ions form rigid gels, calcium gels are strong but more flexibel. Being an extract from natural products, the properties (e.g. gelling behaviour, salt content) may vary from lot to lot.

Carrageenan, iota

highly pure

Weakly gelating Carrageenan of iota type. Forms soft gels. For gelling of watery liquids like culture media for plants or animals in general, and for gelling of dairy products in particular. Manufactured from cultured and controlled sea weeds.

Carrageenan E407

Carrageenans are agar-related hydrocolloids consisting of esters of galactose and anhydrogalactose polysaccarides. Iota Carrageenan is obtained by alkaline extraction from red algae (*Rhodophyceae*) of the order *Gigartinales*, purified by filtration and recovered by alcoholic precipitation. In solutions containing calcium ions, heat-solubilised iota Carrageenan self-assembles into helical structures and gels during cooling. GELRITE®

Gelling agent for microbiological culture media

Alternative to Agar

Storage temp.: +20 °C

GELRITE® is a highly-purified, natural heteropolysaccharide which forms stable, agar-like gels when exposed to soluble salts. Compared to agar however, only about half the amount is required.
GELRITE® has been specially developed as a gelling agent for microbiological culture media. It can however, replace agar in other applications, too. Polymerisation of GELRITE® is enhanced in the presence of (bivalent) kations. It is therefore supplemented by $MgCl_2$ if a solid gel structure is required. Elevated salt concentrations increase gelling temperature (e.g. 500 mM Na^+ to approx. 68 °C with 1 % GELRITE®). When using very high salt concentrations like e.g. seawater, gelling capacity may be significantly reduced.

Chemical composition:
Linear polysaccharide comprising of O-acetylate glycuronic acid, glucose and rhamnose units.

Advantages of GELRITE® compared to Agar:

- consistent product quality, almost 100 % batch-to-batch conformity
- forms remarkably clear gels
- reduces preparation time as gels form faster
- remains stable even at high temperatures and is therefore also ideal for thermophilic microorganisms; gels can withstand repeated autoclaving without any changes to gel strength
- indicates no toxic contaminations (e.g. through phenols, as found in agar)
- is chemically inert against most media additives
- is resistant to enzymatic degradation
- is non-toxic (no signs of toxicity in rats exposed to a dose of 5.000 mg/kg)
- is very economical to use

Roti®-Antibiotic Discs

The range of Roti®-Antibiotic Discs is designed for the qualitative analysis of the sensitivity of bacteria or fungi to anti-microbiological reagents by means of *in vitro* diffusion methods.
A fresh starter culture is adjusted at a cell density of $1x10^6$-$5x10^6$ cfu/ml (in acc. with McFarland Standard 0,5) and applied evenly to a culture medium plate with Mueller-Hinton agar (Art. No. X926 for fungal cultures add 2 % glucose + 0,5 µm methylene blue). The antibiotic discs are individually applied to the plate using sterile tweezers or a dispenser (Art. No. 1505). After a suitable period of incubation, the size of the inhibiting zone around the discs is measured.
The diameter of the inhibiting zone is assessed using standardised values in the available standards and databases and is an indicator of the culture's sensitivity to the antibiotic.

Storage temp.: -20 °C • Transport temp.: cooled

Antibiotics/Antimycotics

Reliable quality for microbiology, molecular biology and cell culture.

Denoted concentrations of working solutions are guiding values and have to be established for each application and cell type.

Actinomycin D

≥95 %, for biochemistry

Peptide antibiotic. Pure actinomycin C_1.

Actinomycin IV, Actinomycin C_1, Dactinomycin

$C_{62}H_{86}N_{12}O_{16}$ • M 1255,5 g/mol • Storage temp.: +4 °C

Danger H300

Specific inhibitor of DNA-dependent RNA-synthesis. Inhibition is caused byintercalation in dsDNA and, therefore, is not specific for procaryotic cells. Standard application is the preparation of cDNA. Actinomycin D is cytostatic, toxic and sensitive to light. Stock solution should be kept in a bottle covered with foil.
Stock solution 10 mg/ml in DMSO or methanol.
Storage of stock solution: -20 °C
Working concentration: 50 µg/ml

Bacitracin

≥60 IU/mg, Ph.Eur., for biochemistry

Peptide antibiotic and protease inhibitor.

$C_{66}H_{103}N_{17}O_{16}S$ • M 1422,72 g/mol • Storage temp.: +4 °C

Inhibits cell wall biosynthesis in gram-positive bacteria and *Neisseria* by interaction with murein biosynthesis.
Also used as protease-inhibitor for inhibition of the gluthatione-insuline-transhydrogenase or some endopeptidases.

Application:
Stock solution: 100-1000 mg/ml in H_2O or ethanol
Storage of stock solution at -20 °C
Working concentration: 0.1-1 mg/ml (0.07-0.7 mM)
Bacitracin is very stable in a pH range of 4-5, but is rapidly inactivated in pH of over 5 at room temperature.
Do not use at a pH of over 8.

Cephalosporin-antibiotic, Cefoxitin sodium salt

$C_{16}H_{16}N_3NaO_7S_2 \cdot HCl$ • M 449,43 g/mol • Storage temp.: +4 °C

Danger H334-H335-H315-H319-H317

Semi-synthetic second generation cephalosporin derivate. Cefoxitin interferes with peptidoglycan layer composition during cell wall synthesis and is effective against a broad spectrum of gram-positive bacteria. Its effectivity against gram-negative bacteria is lower. Also active against anaerobic bacteria. Zone of inhibition analysis with Cefoxitin is used to detect methicilin resistance. Stable against cleavage by β-lactamase. Sensitive to light and temperature!

≥98 %, for biochemistry

Glutarimid antibiotiotic, fungicidal

Naramycin A, Actidione

$C_{15}H_{23}NO_4$ • M 281,36 g/mol • Storage temp.: +4°C

Danger H300-H360D-H341-H411

Antibiotic isolated from *Streptomyces griseus*. Its main biological activity is translation inhibition in eukaryotes by binding to the 60S subunit of the ribosomes. Cycloheximide inhibits binding of Aminoacyl-tRNA to the ribosomes, Peptidyltransferase, detachment of deacylated tRNA, and translocation of Aminoacyl-tRNA, resulting in cell growth arrest and apoptotic cell death. Not effective against bacteria.
Cycloheximide is widely used for selection of cycloheximide-resistant strains of yeast and fungi, for inhibition of eukaryotic contaminants in bacterial microbiology, for controlled inhibition of protein synthesis in cell culture and for detection of short-lived proteins, and for apoptosis induction or facilitation of apoptosis induction by death receptors.
Stock solution: 10 mg/ml in H_2O or acetone
Storage of stock solution at -20 °C
Working concentration: 1-10 µg/ml
Note: Inactivated at basic pH values. Heat- and acid stabile.

Bacteriostatic antibiotic

Oxamycin, D-4-Amino-3-isoxazolidinone

$C_3H_6N_2O_2$ • M 102,09 g/mol • Storage temp.: +4 °C

Bacteriostatic against gram negative and gram positive bacteria and some protozoans by inhibition of synthesis of the cell wall.
Stock solution: 10-100 mg/ml in H_2O and 96 % ethanol
Stability of stock solution: Neutral or acidic solutions are unstable. Sodium carbonate buffered solutions (pH 10) may be stored at +4 °C for approx. 7 days without loosing activity.
Recommended storage of stock solution at -20 °C (6 months).
Working concentration: 20-100 µg/ml
Note: Optimum of activity at pH 6.4-7.4.
It is recommended to prepare fresh solutions each time for use.

Erythromycin

≥93 %, for biochemistry

Macrolide antibiotic

$C_{37}H_{67}NO_{13}$ • M 733,95 g/mol • Storage temp.: RT

Erythromycin is a macrolide antibiotic (macrocyclic lactone antibiotic) which is produced from an actinomycete strain (*Saccharopolyspora erythraea*, formerly known as *Streptomyces erythraeus*). Its spectrum of activity is similar to but broader than that of penicillin, which means that erythromycin is also very effective against bacteria such as legionella or mycoplasma. Erythromycin binds to the bacterial 70s rRNA, interferes with the aminoacyl translocation and consequently inhibits biosynthesis. It is used in microbiological fungal culture to prevent bacterial growth and as a selection marker for selection on bacteria with an erythromycin resistance-mediating gene cassette (*erm*).
Stock solution: 10 mg/ml in ethanol
Store stock solution at -20 °C (2 months)
Working concentration: 0.1-5 µg/ml
pH-optimum at 8.5. Only stable for approx. 24 hours at pH-range 7 to 7.5. Extremely unstable below pH 6.0

Geldanamycin

≥98 %, for biochemistry

HSP90 inhibitor, tyrosin kinase inhibitor. Benzoquinone ansamycin antibiotic. Binds specifically to the heat shock protein HSP90.

$C_{29}H_{40}N_2O_9$ • M 560,64 g/mol

Storage temp.: -20 °C • Transport temp.: room temp.

The specific binding of geldanamycin to heat shock protein 90 (HSP90) and its ER homologue GP96 leads to inhibition of the chaperone, results in degradation of Hsp90 substrates and, subsequently, to deregulation of central cell mechanisms - cell cycle, cell proliferation, apoptosis/cell vitality. Geldanamycin arrests cells in G_2 phase, thus interfering with angiogenesis and oncogenesis. Due to its antitumor potential it may be used as antibiotic against several eucaryotic carcinogenic cell lines. Additionally, geldanamycin is used as inhibitor of tyrosin-kinase and during analysis of several other physiological regulatory mechanisms.

Application:
Stock solution: 1000x in DMSO or methanol
Storage of stock solution at -20 °C, max. 2 weeks at 4 °C
Working concentration: 1-10 µg/ml
Photo sensitive! Store protected from light.

Geneticin (G418 Sulphate)

≥650 U/mg, for biochemistry

Aminoglycoside antibiotic

Antibiotic G418, Geneticin disulphate, G418 sulphate

$C_{20}H_{40}N_4O_{10} \cdot 2\ H_2SO_4$ • M 692,70 g/mol • Storage temp.: +4 °C

Danger H334-H317

Inhibits protein biosynthesis by binding to ribosomes, particularly to eukaryotic 80S ribosomes. Through interference with the tRNA docking process, sequence errors appear and the elongating peptide chain is truncated. Geneticin disulphate unspecifically effects all cells, and is highly toxic for eukaryotic cells. Resistance is mediated by the bacterial enzyme aminoglycoside-3-phosphotransferase.
Application: Selection of transfected eukaryotic cells
Resistance gene: *Neomycin*
Stock solution: 10-50 mg/ml in H_2O or culture medium
Storage of stock solution: -20 °C
Working concentration: 50-1000 µg/ml, has to be established for each cell type

Geneticin (G418)-solution ready-to-use S

CELLPURE® 50 mg/ml, steril

Aminoglycoside antibiotic. For cell culture, biochemistry and molecular biology.

Aqueous G418 sulphate solution, G418 solution

$C_{20}H_{40}N_4O_{10} \cdot 2\ H_2SO_4$ • M 692,70 g/mol • Storage temp.: +4 °C

Danger H334-H317

Inhibits protein biosynthesis by binding to ribosomes, particularly to eukaryotic 80S ribosomes. Through interference with the tRNA docking process, sequence errors appear and the elongating peptide chain is truncated. Geneticin disulphate unspecifically effects all cells, and is highly toxic for eukaryotic cells. Resistance is mediated by the bacterial enzyme aminoglycoside-3-phosphotransferase.
Application: Selection of transfected eukaryotic cells
Resistance gene: *Neomycin*
Endotoxins: <10 E.U./ml
Stock solution, specifically suitable for cell culturing
Working concentration: 50-1000 µg/ml, has to be determined for each cell type.

Hygromycin B

>950 µg/mg, for biochemistry

Aminoglycoside antibiotic.

$C_{20}H_{37}N_3O_{13}$ • M 527,53 g/mol • Storage temp.: +4 °C

Danger H300+H310+H330-H318-H334-H317

Inhibits protein biosynthesis in pro- and eukaryotes by altering translocation during ribosomal chain elongation, therefore resulting in frame reading errors and abortion of chain elongation. Selection marker for *hph* transfected cells.
Stock solution: 50-400 mg/ml in H_2O or PBS.
Storage of stock solution at -20 °C.

Mitosis inhibitor

$C_{15}H_{18}N_4O_5$ • M 334,30 g/mol • Storage temp.: +4 °C

Danger H300-H351

Covalent linkage to DNA. Causes cross-linking of complementary DNA-strands and strand breakage. Mitomycin C is unstable at low pH-value. Mitomycin C should always be stored away from light.
Stock solution: 1 mg/ml in H_2O
Storage of stock solution: -20 °C
Working concentration: variable (1 µg/ml up to 100 µg/ml)

$C_{12}H_{12}N_2O_3$ • M 232,23 g/mol • Storage temp.: +20 °C

Danger H334-H317

Inhibits proliferation of gram-negative bacteria and coccae by inhibition of topoisomerase II (gyrase) and, therefore, of DNA replication.
Also effective against mycoplasms.
Stock solution: 10 mg/ml in chloroform or toluol
Storage of stock solution: -20 °C

Danger H317-H334

Antibiotic from *Streptomyces fradiae* which inhibits bacterial protein synthesis in a broad range of procaryotes (even in dormant germs).
Inhibition of protein biosynthesis through binding to ribosomal 30S subunits.
Resistance: Neomycin resistance
Main component: Neomycin B

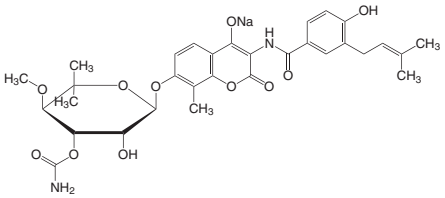
Nourseothricin

≥85 %, for biochemistry and microbiology

Broad-band antibiotic and antimycotic of viruses, bacteria and fungi.



Streptothricine, Nourseothricin dihydrogen sulphate

Storage temp.: +4 °C

Warning H302-H315-H319-H335

Antibiotic of the streptothricine family, effective against a broad spectrum of viruses, bacteria and fungi. Used as selection antibiotic for genetically modified bacteria, yeasts, filamentous fungi, protozoa and plants.
Nourseothricin inhibits biosynthesis and induces miscoding. Resistance is mediated by the *sat1* encoded N-acetyltransferase, which inactivates nourseothricin by acetylation of the β-amino group of the β-lysin.
Streptothricine F: n=1 (MW 599.59), Streptothricine D: n=3 (MW 857.95)
Stock solution: 100 mg/ml in water
Storage of stock solution at -20 °C
Working concentration: ca. 100 µg/ml
Recommendation: One package Nourseothricin should be solubilized in whole and the stock solution should be frozen in aliquots. By removing the overlaying argon during weighing, the stability of the lyophilsate is reduced.

Novobiocin

≥850 µg/mg, for biochemistry

Bacteriostatic antibiotic, HSP90 inhibitor, Novobiocin sodium salt

$C_{31}H_{35}N_2NaO_{11}$ • M 634,62 g/mol • Storage temp.: +4 °C

Warning H319-H317

Reduces growth of gram-positive bacteria by inhibition of initiation of DNA-synthesis via binding to ATP-binding sites of gyrase and topoisomerase. Novobiocin also interacts with the C-terminal ATP-binding site of HSP90, hence inhibiting its Chaperon quality.
Also well suited as additive to microbiological nutrient media. Adding 40 mg/l Novobiocin during selective detection of coliform bacteria on Brilliant Green Bile broth (Art. No. CL06.1) efficiently reduces the growth of attendant flora (Alcaide et al., 1982, *J. Appl. Bact.* 53:143-6).

Pen/Strep-PreMix

CELLPURE®

For elimination and prevention of bacterial contamination in cell culture.

Storage temp.: +4 °C

Danger H302-H317-H334-H361d

Antibiotic compound of penicillin, streptomycin and stabilising sodium chloride for application in cell culture. The premixed powder is extremely stable during storage at room temperature and, due to the excellent solubility of the reagents in pyrogen-free water (e.g. Art. No. 3255.1), it can be mixed quickly to a 100x stock solution.

Penicillin inhibits cell wall biosynthesis in Gram-positive bacteria. Streptomycin produces the antibiotic effect in Gram-negative bacteria through inhibition of the translation.
The dissolved antibiotics are stable for approx. 3 days at 37 °C.
The final concentration of the 100x stock solution is:
Penicillin: 10.000 I.U. / ml
Streptomycin: 10 mg / ml
Sodium chloride: 0.9 %

Endotoxin content per vial: ≤210 I.U. complies ≤4.2 I.U. / ml

Application: The pack contains 2 vials with premixed powder for 2 times 50 ml 100x stock solution. 50 ml of the 100x stock solution can be obtained directly by adding 49.2 ml pyrogen-free water (Art. No. 3255).
We recommend application in a 1:100 dilution.
The stock solution mix (100 ml) is sufficient for 10 l medium.
Storage of stock solution: in 1-10 ml aliquots at -20 °C.
Comes with original seal.

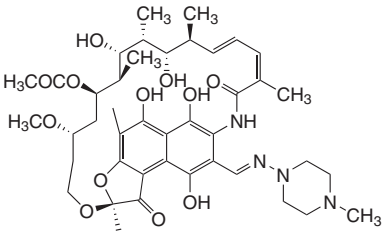
Radicicol

≥98 %, for biochemistry

Strong HSP90 inhibitor, macrolactone antibiotic. Binds specifically to the heat shock protein HSP90.

$C_{18}H_{17}ClO_6$ • M 364,79 g/mol



Storage temp.: -20 °C • Transport temp.: room temp.

Danger H301-H315-H319-H335

The strong specific binding of radicicol to heat shock protein 90 (HSP90) leads to deregulation of its target mechanisms: cell cycle, cell proliferation, apoptosis/cell vitality. Also binds to yeast HSP90, *E.coli* HtpG and TRAP-1. Antifungal effects are probably caused by inactivation of chitin synthase in fungal cells.

Application:
Stock solution: 10 mg/ml (27 mM) in ethanol or DMSO
Storage of stock solution at -20 °C, max. 2 weeks at 4 °C
Working concentration: 5-300 µM
Photo sensitive! Store protected from light.

Bacteriostatic antibiotic

3-(4-Methylpiperazinyliminomethyl)rifamycin SV

$C_{43}H_{58}N_4O_{12}$ • M 822,94 g/mol • Storage temp.: +4 °C

Warning H302-H315-H319-H335

Rifampicin inhibits bacterial DNA-dependent RNA-polymerase and consequently prevents transcription. Its spectrum of activity is strictly bacterial (the eukaryotic DNA-dependent RNA-polymerase can only be inhibited at extremely high concentrations) and rifampicin is particularly very effective against mycobacteria. Enterbacteria, acinetobacteria and pseudomonades are resistant against rifampicin. The resistance-mediating genes can be applied as selection markers in molecular biology. Light-sensitive. Store in the dark!
Stock solution: 100 mg/ml in chloroform or DMSO, 15 mg/ml in methanol, 1 mg/ml in water (pH 7,3)
Store stock solution at -20 °C, is stable for approx. 2 weeks in DMSO when stored in the dark at 4 °C
Working concentration: 20-200 µg/ml
Art. No. 4163.3: A stock solution with a concentration of 100 mg/ml can be prepared directly by adding 5 ml chloroform or DMSO.

β-Lactam antibiotic

α-Carboxy-α-3-thienylmethylpenicillin disodium salt, Ticarcillin · 2 Na

$C_{15}H_{14}N_2Na_2O_6S_2$ • M 428,4 g/mol • Storage temp.: +4 °C

Danger H334-H335-H315-H319-H317

Ticarcillin belongs to the carboxy penicillin family, the only difference to carbenicillin being a group of a side chain. It is inactivated through β-lactamase. Ticarcillin inhibits bacterial cell wall synthesis by inhibiting the transpeptidase.
Stock solution: 100 mg/ml in water
Store stock solution at -20 °C
Working concentration: 25-250 µg/ml
The stock solution should be cooled immediately as its activity decreases quickly and ticarcillin may precipitate.

The History of Antibiotics

In the history of mankind there have always been highly developed cultures who have possessed remarkable knowledge. For example, surgeons in the ancient world and Middle Ages placed mouldy rags on wounds to prevent infection.

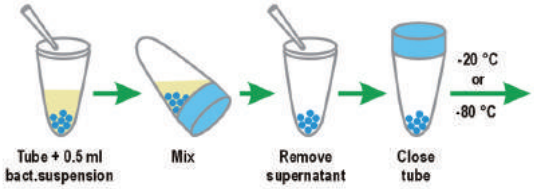
First observations of antibiotic effects in modern times were made by the French chemist Louis Pasteur in the 19th century, who discovered that certain bacteria could kill anthrax germs. The German bacteriologist Rudolf von Emmerich isolated the antibiotic medium pyocyan (cholera and diptheria) around 1900 and in 1910 experiments carried out by the German doctor and chemist Paul Ehrlich led to the development of salvarsan (syphillis and tropical diseases).

Penicillin was discovered by accident in 1928 by Alexander Fleming in *Penicillium notatum* mould fungus cultures when he observed that in laboratory cultures *P. notatum* inhibited the growth of vicinal bacteria colonies. Streptomycin followed in 1943.

The first antibiotics were isolates from bacteria cultures. The preparations used nowadays, however, are almost exclusively of chemical origin, which has enabled specialisation and optimisation.

Cryo-Conservation

Roti®-Store cryo vials



ready-to-use S

Sterile. Suitable for freezing all types of microorganisms, including recombinant bacteria.
Storage temp.: +4 °C

- Preparation of cryogenic cultures
- Safe storage
- Simple recultivation

Roti®-Store cryo vials are ideal for preparing freezing stocks from different microorganisms, even DMSO-sensitive organisms. The stocks are protected by a special cryo medium during freezing.
Optimally suited for cryopreservation of recombinant bacteria in genetic engineering.
Store at -80 °C or in liquid nitrogen.
Short-term storage for a few days at -20 °C is possible.
Also suitable for conservation of marine microorganisms, even during field work (Siebert *et al.*, *Appl. Environ. Microbiol.* 2004 (70) 5912-5).
∅ 11 mm, length 47 mm.

Instructions:
To freeze, pipette and mix 0.5 ml fresh culture solution into a Roti®-Store cryo vial. Remove the supernatant and freeze the vial. To recultivate, take one of the glass pellets and inoculate the desired culture medium.

One cryo vial contains 25 glass pellets suitable for 25 recultivations per cryogenic culture.

Roti®-Store yeast cryo vials

ready-to-use S

Sterile. Ideal for freezing yeast and monocellular moulds.
Storage temp.: +4 °C
Roti®-Store yeast cryo vials contain a special yeast cryo medium, developed for safe storage of yeasts such as *Saccaromyces cerevisiae* or *Candida albicans*.
Cryo-conversation has been succesfully tested for *S. cerevisiae*, *C. albicans*, *C. sake*, *C. tropicals*, *Zygosaccharomyces rouxii*, *Dekkera bruxellensis* and *Malesezzia furfur*.

The yeast is protected by a special yeast cryo medium during freezing.
Long-term storage at -80 °C or in liquid nitrogen, short-term storage for a few days at -20 °C is possible.
Suitable for preparing 50 different cryo-cultures and for up to 25 recultivations per cryogenic culture.

Anaerobic Jar

By schuett-biotec. Break-proof and ageing-resistant container made of rustproof, robust stainless steel or transparent polycarbonate enables the growth of the colony to be monitored without opening the container.

The anaerobic atmosphere can be generated in the vessels by evacuating using a vacuum pump and gassing (e.g. with nitrogen) or with chemical anaerobic systems.

Connectors:

The lid, made of UV-stable black plastic (POM) or transparent polycarbonate (PC), is equipped with a ventilation screw on the "eco" and "crystal eco" models.

The lids of the "small", "standard", "large" and "crystal" models are equipped with two corner valves including chemical-resistant hose connectors for gassing hoses and vacuum hoses (5 mm inner diameter) and provided with a pressure gauge for precisely monitoring the vacuum or overpressure (-1 to +0,2 bar).

Capacity:

The "standard", "eco", "crystal" and "crystal eco" vessels can be used with up to 15 Petri dishes with a diameter of 60-100 mm.

The "small" anaerobic vessel is suitable for up to 10 Petri dishes with a diameter of 60-100 mm.

The "large" vessel can hold up to 15 Petri dishes with a diameter of 60-150 mm.

Turbidity standards

McFarland BSS 0,5 ready-to-use

for microbiology

Turbidity Standard for adjusting the density of a bacterial suspension.

Turbidity Standard, Barium sulphate suspension

Storage temp.: +20 °C • Transport temp.: room temp.

The McFarland BSS Standards are used as turbidity standards since 1907 to produce an expected reproducible cell density of a bacterial suspension. The cell density is adjusted in the simple comparison to the standard. This can be directly performed visually or by measuring with a spectrophotometer.

The turbidity value of the standard of 0,5 MFU (McFarland Units) corresponds to approximately a culture density of 1,5 x 10^8 cells/ml. This cell density is specially needed as bacterial inoculum for the antibiotic susceptibility test.

The McFarland PMS Standards are equivalent turbidity standards to the original barium sulfate standards. The optimised Polymer Microparticle Suspension (PMS) separates slower than the barium sulfate version. The cell density is adjusted in the simple comparison to the standard. This can be directly performed visually or by measuring with a spectrophotometer.

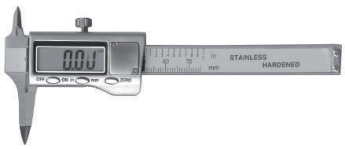
Antibiotic Disc Dispenser

By HiMedia. With the antibiotic disc dispenser, up to eight Roti®-Antibiotic Discs can be evenly placed on a culture medium at the same time.
The antibiotic disc dispenser is suitable for Petri dishes with a diameter of 90 mm.

The base ring of the dispenser can be easily adjusted to the height of the culture medium without the need for additional tools.

The required combination of antibiotic disc cartridges are inserted into the slots in the dispenser until a click is heard. The loaded dispenser is positioned over the Petri dish. Carefully pressing the plunger all the way down with one hand pushes one antibiotic disc out of each cartridge onto the culture medium.

The dispenser can be operated with one hand, meaning that antibiotic sensitivity tests can be set up quickly for the disc diffusion method. This saves time, especially when a number of samples are to be tested.



The dispenser is supplied in a practical storage container to protect it from moisture.

When the dispenser is not in use, it should be stored at a temperature between 2-8 °C and should be brought to room temperature shortly before use.

For use with Roti®-Antibiotic Discs.

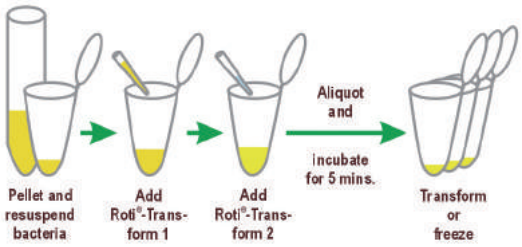
Kit for preparation of competent cells



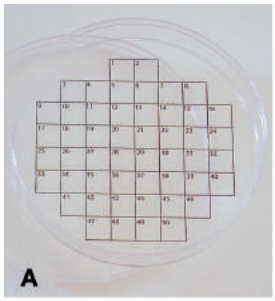
Roti®-Transform ready-to-use S

Sterile. For preparation of competent *E. coli*.
Storage temp.: -20 °C • Transport temp.: room temp.

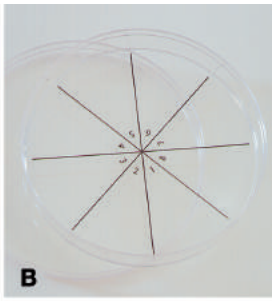
- Flexible selection of strains
- Effective, simple and fast
- Adequate for 500 transformations

Roti®-Transform
Roti®-Transform is a simple, effective and fast method of producing competent *E. coli* in three steps. The competent cells may be used directly for transformation or may be frozen for later transformations. Transformation efficiency is 5 x 10^5 to 1 x 10^6 colonies per µg DNA.

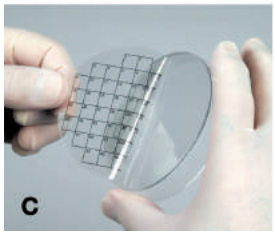
Protocol:
1. Resuspend cells in fresh, cold LB-medium
2. Add Roti®-Transform 1
3. Add Roti®-Transform 2 and incubate for 5 minutes on ice



Long-term Storage of the Kit at -20 °C.



Storage for use:
Reagent 1: Short-term storage may be done at 4 °C.
For long-term storage of over 14 days we recommend a storage temperature of -20 °C.
Reagent 2: Storage at 4 °C.



Roti®-Transform consists of 45 ml Roti®-Transform 1 (Art. No. P041) and 5 ml Roti®-Transform 2 (Art. No. P042). One kit is sufficient for producing competent *E. coli* for 500 transformations.
Contents of this Kit may not be bought separately.

Replicator stamp

Replicator stamp for transfer of bacterial or yeast colonies from one culture medium plate to another. Stamp with fixationring in yellow coloured. 12 autoclavable transfer tissues are included. Transfer tissues may also be bought separately in colours blue, red, and beige (for brightly coloured colonies).

In order to duplicate the colony plates, fix one of the sterile tissues on the stamp with the aluminium ring (see figure). Then press the top side of the original colony plate gently onto the stamp. For cloning press a fresh plate onto the inoculated tissue surface.

Applicable for petri dishes of 90 to 100 mm diameter. The replicator stamp is made of PVC. Height: 72 mm, diameter: 81 mm. Fixation rings are made from coated aluminium. Transfer tissues are made from an autoclavable cotton-polyester mix. Size of one tissue: 15 x 15 cm. The stamps can be disinfected with ethanol (sanitisation).

for histology

Clearing agent on base of limonene.
For dewaxing of histological sections. Alternative product for xylene.

Danger H304-H226-H400-H410-H315-H317

Roti®-Histol is a natural product, manufactured from untreated orange peel. It consists of 96-98 % limonene, a terpene with a characteristic odour of lemon or orange.
Roti®-Histol replaces current clearing agents without the need for changing working procedures. **No harmful vapours!** It can be mixed with IPA, butanol, ethanol and all standard embedding media.

Clearing with Roti®-Histol prevents tissue samples from hardening and brittleness. It is particularly suitable for manual work which usually exposes the user to solvent vapours in high concentrations.

Roti®-Histol produces excellent results with **Roti®-Histokitt** mounting medium **(Art. No. 6638)** and special paraffins such as Roti®-Plast (Art. No. 6642).

Roticlear® on base of aliphatic hydrocarbons

The alternative product for use in histology and cytology. Roticlear® is a special formulation to replace toluene, xylene and trichloromethane. Excellent for dewaxing histological sections.

▶ Compatible mounting media for xylene and xylene alternatives see page 1542

Roticlear® ready-to-use

for histology

Clearing agent of aliphatic hydrocarbons, practically free from aromatic compounds. For dewaxing of histological sections. Alternative product for xylene.

Danger H226-H304-H336-H412-EUH066

Roticlear® consists of different aliphatic hydrocarbons with only little own odour. It is **practically free from aromatic compounds** (≤0,005 %) and can be mixed with IPA, butanol, ethanol and acetone.

Roticlear® can be used like xylene. The absorption capacity for paraffin is even better than that known from xylene. Therefore, water baths for removing the paraffin need not to be changed so frequently. Due to a short evaporation period, Roticlear® enables fast and effective working.

Roticlear® produces excellent results with **Roti®-Mount (Art. No. HP68)**. After clearing with Roticlear® the sample can be embedded in Roti®-Mount immediately.

Roticlear® can be used in automates without any difficulty.

Xylene

Xylene is the typical solvent in histology. ROTH xylenes have been used very successfully in histology for dewaxing histological sections and as clearing agent.

Xylene can be used together with **Roti®-Histokitt II mounting medium (Art. No. T160)** and ROTH paraffins such as Roti®-Plast special paraffin (Art. No. 6642).

For additional product data and safety information, see chapter Chemicals A-Z.

Please note:
Xylene can only dissolve a limited amount of paraffin, it should therefore be changed frequently. Please also note that the solubilizing process is often very slow at low temperatures. We recommend working in a warming cupboard at 25 to 30 °C.

Our Tip:
You can use a pipe wrench to open the solvent canister 10 l and 25 l. However, it's much easier and simpler with our **barrel and keg key** (Art. No. 0398).

Safety data sheets
can be found on the Internet next to the product description.

Isopropanol as clearing agent
Isopropanol is well suited as clearing agent for paraffin-embedding, because it is compatible to melted paraffin: After dehydrating with isopropanol the sample is incubated in a mixture of isopropanol abs. and paraffin (1:1) at approx. 60 °C. After a further incubation step with pure paraffin, the sample is embedded as usual. This method is particularly suitable to smooth organs. Since embedding can start immediately after alcohol step, the working process is shortened significantly.

Alcohols

Variously usable in histology: for hydration and dehydration (series of alcohol), for fixation, as an ingredient of staining solution etc.

Differentiating solution for histological staining.

Hydrochloric acid in ethanol

After staining tissues are rinsed with HCl-ethanol solution to remove excessive stain. This decolourisation is selective for certain tissue structures retain the stain better than others (differentiation). HCl-ethanol solution is used for regressive hemalum staining, but also for detection of mycobacteria.

Reagents for Decalcification

Tissues containing solid material such as bones or keratin are to be decalcified before paraffin embedding. Usually the specimens are treated with acids of different concentrations and mixtures.

An especially gentle method is decalcification with EDTA solution.

Decalcifier soft ready-to-use

SOLVAGREEN® for histology

Decalcifier solution on base of EDTA.
Used for gentle decalcification of bones and other calcified tissues.
The solution is also suitable for immunological applications.

Danger H290-H314-H373

The solution contains 25 % EDTA. The process of decalcification takes more time than acid decalcification (see Decalcifier standard, Art. No. 6483), e.g. bone biopsies need approx. 3-4 days. The procedure can be accelerated by using a magnetic stirrer. The decalcification takes place in a weakly basic milieu. Nucleic acids and enzymes are not affected; therefore, the solution is also suitable for immunological applications.

Decalcifier standard ready-to-use

for histology

Acid-based decalcifier. Contains trichloracetic acid and formalin.
Used for acid decalcification of bones and other calcified tissues.

Danger H314-H335-H350-H411-EUH208

The solution contains trichloroacetic acid and formalin and, therefore, has also fixing qualities. Nevertheless, we recommend sufficient fixing of specimens before decalcifying for trichloroacetic acid may cause morphological changes in unfixed tissue. The length of the decalcification process depends on the specimen's size and type. Little bones (diameter a few mm) need 1-2 days for complete decalcification.
The decalcifier standard is not suitable for immunological applications. We recommend our Decalcifier soft (Art. No. 6484) on base of EDTA.

Blocking Reagents

In immunohistological assays it is necessary to block non-specific antibody binding sites or other unspecific protein-protein-interactions.
For that purpose ROTH offers protein-containing and protein free blocking reagents.

Buffer solution acc. to Weise

for histology

Stabilized buffer concentrate for the preparation of buffer solution according to Weise.

- Ready for use immediately - no dissolving of tablets or powder
- Microfiltered solution - no disturbing suspended particles
- Economical use - **10 ml concentrate on 1 l distilled water (= working solution)**
- Demand-oriented packaging - pouches or bottles

Buffer solution according to Weise is a phosphate-buffered salt solution which is mainly used for staining blood and bone marrow smears, e.g. for diluting the Giemsa stock solution in Pappenheim staining.

The buffer concentrates are available in three different pH variants. The prepared solutions are stable for approx. 4 weeks.

Formalin-free Fixing Solution

ready-to-use

An adequate substitute for formalin on base of hexamethylene tetramine. Roti®-Histofix ECO Plus is classified as non-hazardous.

Roti®-Histofix ECO Plus

SOLVAGREEN® Fixing agent without formalin

For fixing of histological and immunochemical specimens.
Formalin substitute.
Storage temp.: +20 °C

- Formaldehyde-free, non-toxic fixative
- Good fixation properties
- pH 4,5 -5,0
- No denaturing effect, e.g. shrinkage or crosslinking
- Adequate substitute for formaldehyde

Roti®-Histofix ECO Plus is a ready-to-use, aqueous solution on base of hexamethylene tetramine. The solution has as similar good fixation properties as formaldehyde, but is, unlike formaldehyde, classified as non-toxic. The original morphology of the tissue is preserved during the fixation process. The protein molecules are cross-linked in a reversible way, their structures are preserved. That is especially important for antigen-antibody reactions. Samples are - in contrary to other fixative media - free of artefacts such as shrinkage of tissue or irreversible protein crosslinking. The solution is therefore ideal for immunohistochemistry. All conventional staining processes can be carried out following fixation.
Roti®-Histofix ECO Plus is scented for better identification (< 1ppm).

Formalin-free, non-toxic solution. For fixing of histological specimens.
Pleasantly aromatic odour. Forrmalin substitute.

Do not store formaldehyde solutions below +15 °C!

Experience shows that low temperatures support polymerisation to paraformaldehyde. Small amounts of solids (fine precipitation) can be filtered off, the formaldehyde solution is still fully functional. In case of major amounts of solids, however, the solution should be discarded, for the concentration of formaldehyde is too much reduced.

Ready-to-use Formaldehyde Solutions

ready-to-use

Roti®-Histofix solutions are **stabilised formaldehyde solutions**. The added phosphate buffer (pH 7) neutralises formic acid formed by oxidation of formaldehyde during storage. Furthermore, a small amount of methanol is added to protect against polymerisation.

Roti®-Histofix in prefilled containers

Fixative for histology, prefilled in screw cap containers.
Stabilised with methanol.
Storage temp.: +15-25 °C

Danger H302-H317-H341-H350

Neutral buffered formaldehyde solution (pH 7), prefilled in screw cap containers, packaged in a cardboard shipping box. The containers are labelled, specimen data can be added.

- Specimen can be added directly
- Sample is securely packaged and ready for shipment within a short time
- Reduced health risk for user because no diluting and decanting of concentrated formaldehyde solution is necessary
- Time saving, containers are ready-to-use

To prepare a 4 % paraformaldhyde solution:
Mix 4 g of paraformaldehyde into 60 ml distilled water (milky liquid), heat with frequent agitation to 60 °C. Add drop wise 1N NaOH, at pH 7 the solution becomes clear. Add distilled water until the volume reaches 100 ml then let it cool down. The solution is to be used immediately, because it is not stable at room temperature. Store in aliquots at -20 °C, is stable for approx. 6 months.

Fixing Agents for Cytology

Fixation

Fixing agents: In order to stop their natural degradation process, specimens must be fixed as quickly as possible after extraction. This is usually done with pure fixing agents such as formalin or alcohol. The solutions are easy to use and lead to good results. Formalin, despite its smell and harmful properties, is still the universal fixing agent, whereas alcohol has proved to be best when fixing smears. To get fixing agents with special properties, mixtures from different fixing agents should be used. This also will compensate for the distinct handicaps of many fixing agents, e.g. shrinkage caused by high-percentage alcohol is greatly reduced when glacial acetic acid is added.

Fixing process: Alcohols, various salts and acids denature the protein molecules. The structurally altered molecules form cross-links between each other. In contrast, formalin does not denature. It binds directly to proteins and cross-links the molecules actively with each other.

Fixation of pure lipids or carbohydrates is extremely difficult. When using conventional fixing agents, they are only trapped in the tissue and often washed out in subsequent rinsing steps. Better results are achieved with frozen sections. In electron microscopy lipids can be fixed with osmium tetraoxide.

To prepare a 1-4 % solution of osmium tetraoxide, Art. No. 8371:

- Score the glass ampoule in centre (e.g. with glass cutter Art. No. 8209.1)
- Open it carefully at the section
- Draw the crystals into a sealable glass jar
- Add the needed amount of distilled water
- Place the sealed jar into an ultrasonic bath, the dissolution process requires 1-2 h
- Store the solution in aliquots at -20 °C in a well-sealed container

Please note: OsO_4 vapours damage the cornea and the mucous membranes of the mouth and the nose. Therefore, working with protective equipment in a fume cupboard is required!

Paraffins

In order to meet the different requirements of paraffin embedding, we provide a large selection of paraffins.

Special paraffin Roti®-Plast

- High-purity paraffin
- Top-quality for routine applications
- Available with or without DMSO
- Defined melting range
- Excellent embedding and cutting properties
- Guaranteed tested quality

Roti®-Plast

100 % paraffin, for histology
Melting range: 54-56 °C
Roti®-Plast is a special paraffin of highest quality without any additives. It penetrates the tissue quickly, completely and gives it its plasticity.

Type analysis:
Appearance. ..... white pastilles
Solidification point. ..... 54-56 °C

Roti®-Plast with DMSO

paraffin, for histology
Melting range: 56-58 °C
Special paraffin, treated with DMSO, enriched with polymers. Makes it easier to penetrate the tissue.

Type analysis:

Please note:
Protein glycerol (Art. No. P049) contains egg albumin, colloidally dissolved in glycerol. At room temperature it may flocculate. But it will redissolve by gentle warming.

Low Melting Paraffins

These paraffins allow embedding already at temperatures below 55 °C.

If high solid tissue blocks are required, we recommend a final embedding step at standard temperature (56-58 °C).

Paraplast®-Paraffins

Published on the authority of Leica Biosystems.

Paraplast® is recommended for general tissue embedding. It is composed of a refined mixture of highly purified paraffin containing plastic polymers of regulated molecular weights. This provides improved tissue infiltration and superior quality sections with minimal compression. Paraplast® gives brittle, difficult-to-section tissue an innate elasticity, producing excellent, wrinkle-free sections.

- Good reproducibility

Staining Methods for Blood Smears

ready-to-use

We offer staining solutions for classic preparing of blood elements and for other standard assays, e.g. detection of blood parasites or bacteria.

LOEFFLER's methylene blue solution
for microscopy and cell counting

For visualising nuclei.

Methylene blue solution 0,5 %

LÖFFLER'S methylene blue solution is used for staining bacteria, fungi and blood parasites in blood smears, e.g. together with carbolic fuchsine solution (Art. No. A130) for Ziehl-Neelsen staining (detection of TB bacteria). Furthermore, it is used as a vital staining agent for selective staining of nuclei during counting of eukaryotic cells.

May-Gruenwald's solution
for microscopy

For differential staining of blood smears and cytological specimens.

Eosine methylene blue solution

Danger H225-H370-H301+H311+H331

May-Gruenwald's solution is a methanolic solution of eosin methylene blue. Due to the high concentration of methanol, the specimens are fixed at the same time (recommended residence time: 3 min).
May-Gruenwald's solution is used for differential staining of blood smears and cytological specimens.

Staining kit for visualising connective tissue (Masson-Goldner trichrome staining), incl. instructions for use.
Storage temp.: +20 °C

Danger H225-H290-H315-H318-H317-H33

Application: Firstly the nuclei are stained with Weigert's iron hematoxylin solution, an acidoresistant staining. Subsequently the trichrome staining is carried out with the acid stains acc. to Goldner. Every staining step is followed by a rinsing step with acetic acid 1%. This reagent is not included to the kit.
Result: Visualisation of nuclei, cytoplasm, muscle, erythrocytes, connective tissue.

Bacteriological Staining

Staining of acid-fast bacteria ready-to-use

Acid-fast bacteria (e.g. Mycobacteria) cannot or only difficult be stained by usual staining methods due to the high proportion of lipids in their cell walls.

The most popular method for staining of acid-fast bacteria is the hot staining method acc. to Franz Ziehl and Friedrich Neelsen (Ziehl-Neelsen staining), in which the cell walls are "melted" by heating.

Furthermore cold staining methods have been developed like Kinyoun, Gabett or Ziehl-Neelsen (cold) to avoid harmful vapours resulting in the hot staining method.

Gram Staining ready-to-use

Gram staining is the most important technique for differentiation and identification of bacteria. It was developed by the Danish bacteriologist Hans Christian Gram (1853-1938).

Due to the structure of their cell walls nearly all bacterial species can be differentiated in gram-positive and gram-negative bacteria.

Gram staining kit
for microscopy

Kit for differentiation of gram-positive and gram-negative bacteria, incl. instructions for use.

Storage temp.: +20 °C

Danger H225-H314-H341-H336-H373-EUH066

This classical staining method allows a quick differentiation of gram-positive and gram-negative bacteria. Subsequently a specific treatment with antibiotics is possible.

Application:
In the first step bacteria are stained by Carbol gentianaviolet and Lugol solution. Afterwards gram-negative bacteria are decolourised by Gram's decolourising solution. In the last step these bacteria are counterstained by Carbol fuchsine solution.

Result:
Gram-positive bacteria appear blue, gram-negative bacteria red.

Formulation:

Carbol gentianaviolet solution (Art. No. CN00). ..... 500 ml
Iodine-potassium iodide solution acc. to Lugol (Art. No. N052). ..... 500 ml

6395.1	100 ml	glass	28,50 €

Performing detection of cellulose:

Add one drop of the solution to the section applied to a slide. After 30 min in maximum cellulose fibres are stained blue; wood, cork and cutin are stained yellow. The cellulose staining is a dichroitic staining. Depending on the polarisation direction of light different wavelengths of light are absorbed. Thus the dye changes from dark blue to colourless.

$C_{16}H_{17}Cl_2N_5$

M 350,3 g/mol

Storage temp.: -20 °C • Transport temp.: room temp.

Fluorescent dye with specific DNA-binding capacity. For detection of mycoplasms in cell culture, for quantitative DNA measurement, and for chromosome counter staining. Store in the dark! Stabile for one year when solubilised, stored at -20 °C, and protected from light
Stock solution: 1 to 10 mg/ml in sterile water

Working concentration:
Nucleus staining in living cells: approx. 1 µg/ml in medium
Nucleus staining in fixed cells or fixed tissue sections: approx. 0.2 µg/ml in PBS, TBS or another incubation buffer
Detection of mycoplasms: 1 µg/ml in methanol

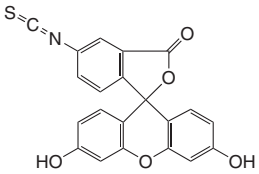
ready-to-use

Ethidium bromide solution 0,5 % in dropper bottle

aqueous solution (5 mg/ml)

For counterstaining of nuclei in histology and cytology.
For staining of DNA/RNA after electrophoresis.

In spite of newly developed fluorescent staining reagents ethidium bromide remains the standard staining technic for nucleic acid in electrophoresis. Ethidium bromide is a carcinogenic substance which shouldn't come in contact with skin. In order to minimise this danger we offer ready-to-use ethidium bromide solution in dropper bottles for easy handling and maximum safety.



Application:
In order to prepare a staining solution add 5 drops of ethidium bromide solution to 500 ml water, buffer, or electrophoresis running buffer, respectively.
Nuclei / nucleic acids are stained red.

Excitation maxima (unbound): 210 nm, 285 nm, 470 nm
Excitation maxima (bound to DNA): 330 nm, 500 nm
Excitation possible via DNA at 254 nm

Emission maximum: 605 nm.

Roti®-Mount

Mountant for microscopy, free from xylene and toluene.
Compatible with Roticlear® (Art. No. A538) and n-Butyl acetate (Art. No. P036).

Danger H225-H304-H372-H411-EUH066

Synthetic mountant for producing durable specimens in histology and cytology, free from xylene and toluene. Not suitable for aqueous samples!
Storage:
For long-term storage we recommend a storage temperature of 4 °C in the dark. For use the product should have room temperature to ensure an ideal consistence.

Type analysis:

Appearance	colourless to light yellowish, viscous liquid
Viscosity (20 °C)	1000-1200 mPas

Mounting with Euparal

ready-to-use

Euparal
for microscopy

Mounting agent

Warning H226-H315-H319

Euparal is an alternative to Canada balsam for mounting microscopic specimens and is used in the same way. Unlike Canada balsam, which is very sensitive to water and can only be used after specimens have been dehydrated with high-percentage alcohol and xylene, mounting in Euparal with 80 % alcohol is possible without any cloudiness occuring. Euparal solidifies slower than balsam.

Refractive index for liquid Euparal: 1.483
Refractive index for completely solidified Euparal: 1.535

The duration of the solidifying process depends on the mounted object and temperature. Euparal solidifies faster when warm.

Euparal-essence (Art. No. A145) serves as a diluent and solvent for euparal. Euparal and Euparal essence are not compatible with organic solvents.

As it is a natural resin and there is no polymerisation, permanent Euparal preparations can be dissolved later under gentle heating with Euparal essence.
Euparal contains Sandarac resin, camphor and salol. Paraldehyde and eucalyptol serve as a solvent.

Hydrophilic Mounting Media

These mounting media allow embedding without previous dehydration. Thus shrinking of specimens caused by organic solvents can be avoided. Additionally the hydrophilic milieu prevents washing out of cell ingredients like lipids, an important requirement for use in histochemistry.

Roti®-Mount Aqua ready-to-use
for microscopy

Aqueous mounting medium

Roti®-Mount Aqua is an aqueous solution of polyacrylate resin used for mounting of paraffin sections and cryostat sections directly after staining. The solution is ready to use. Colours and tissue structures are preserved in an optimal way. For long-term preserving of fluorescent dyes we recommend Roti®-Mount FluorCare (Art. No. HP19).
Application:
Residues of staining solution are removed by rinsing with buffer or destilled water. Afterwards the specimens are mounted with Roti®-Mount Aqua.
Storage:
Store at +4 °C in the dark, shelf life minimum 1 year.

Roti®-Mount FluorCare ready-to-use
for fluorescence microscopy

Aqueous mounting medium with antifading effect.

Storage temp.: +4 °C

Roti®-Mount FluorCare has been developed especially for fluorescene microscopy and is compatible with all current fluorescent dyes. It is an aqueous mountant with an additional antifading reagent which reduces photobleaching drastically. Fluorescence will remain for many weeks. In contrast to other mounting media Roti®-Mount FluorCare does not show autofluorescence at any common wavelength.
Roti®-Mount FluorCare is also available with the dyes DAPI (HP20.1) and propidiumiodide (HP21.1) for simultaneous counter staining of nuclei.
Storage:
The solution should be stored at +4 °C in the dark.
Shelf life: minimum 1 year.

Storage temp.: +4 °C

Roti®-Mount FluorCare PI is an aqueous mounting medium with antifading effect. Additional it contains ready-to-use propidiumiodide allowing counterstaining of nuclei and mounting at the same time. Propidiumiodide has an emission maximum of 535 nm and an emission maximum of 617 nm.
Roti®-Mount FluorCare is also available with the dye DAPI (Art. No. HP20.1) and without dye (Art. No. HP19.1).

Storage:
The solution should be stored at +4 °C in the dark. Shelf life: minimum 1 year.

DABCO is an anti-bleaching reagent. It is combined with hydrophilic mounting media as Mowiol 4-88, Art. No. 0713, or glycerol in order to conserve the colours and the fluorescence of durable samples. Solubility may change depending on the batch. If required stir solution constantly overnight at a temperature of 40-60 °C.

Kaiser's glycerol gelatine phenol-free

for microscopy

Aqueous mounting medium

- Non-hazardous ingredients
- Neutral pH (6-7)
- Convenient also for sensitive stainings

It is an aqueous mounting medium which is solid at room temperature. Composition and application are according to the classical Kaiser's glycerol gelatine; however, it does not contain phenol. The added preserving agent is classified as non-hazardous. The pH value of the product is 6-7. Therefore, it is suitable also for stainings which are sensitive against acids (e.g. hematoxylin). Prior to use the glycerol gelatine is melted on a water bath (max. 50-55 °C) and then dropped onto the slide by using a pipette or a glass rod.

Type analysis:

Glycerol-gelatine (acc. to Kaiser)

Preparation:

Dissolve 10 g gelatine gold in 60 ml water and add 70 ml glycerol.

Add 0.1 g phenol to 100 g mixture, heat 10-25 minutes in the water bath while stirring until purification, then filter hot over glass wool or paper.

Avoid heating much beyond 60 °C, because overheated gelatine loses its ability to solidify.

Phytohistol® plus

ready-to-use

for microscopy

Botanical mounting medium based on sugar

- New compound
- High stability
- No hazardous ingredients
- Neutral pH 6-7

Phytohistol® plus is an aqueous mounting medium based on sugar with the consistency of liquid honey. It is especially suitable for plant materials. After evaporation of the water a rubber-like film remains. For producing durable specimens we recommend to seal the edges of the cover slip with our Roti®-Seal cover slip sealant (Art. No. 6473).
Shelf life: The solution contains a preserving agent and is stable for minimum 4 years after manufacture.
Application: Drop on slide, add specimen. When free from air bubbles place cover slip.

Barrier Marker ready-to-use

Roti®-Liquid Barrier Marker, colourless
For immunology, histology and molecular biology. Glass bottle with brush.

Danger H225-H304-H315-H336-H411-H319

The solution is applied to slides or other glass surfaces. After drying, a resistant hydrophobic film remains providing a barrier to aqueous liquids. Circles drawn with Roti®-Liquid Barrier Marker prevent aqueous solutions from spreading by increasing the surface tension of the water. Therefore expensive antibody solutions for example, can be used more effectively. The barrier film can be wiped off the glass surface with a dry cloth or a cloth impregnated with xylene.
Areas of applications: Ideal for immunological, histological and molecularbiological assays.

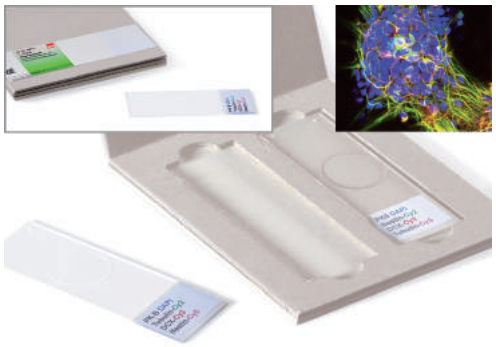
Specimen Sealing

Roti®-Seal

for microscopy

Aqueous cover slip sealant.

- Non-hazardous ingredients
- Solvent-free
- Solidification by light



Roti®-Seal is used to seal the edges of the coverslip. Therefore, it protects the mounted specimen reliably against damages caused by air humidity. Roti®-Seal is solid at room temperature. Prior to use it is melted on a water bath (max. 50-55 °C), then it is applied around the edges of the coverslip by using a pipette or a glass rod. Exposure to light (day-light is sufficient) allows the sealant to harden within a short time.
Melt on a water bath (50-55 °C) prior to use.

Roti®-Bond Adhesion Slides

Fast and highly efficient immobilisation of cellular material with optimal structure conservation.

The new adhesive coating of the Roti®-Bond adhesion slides reacts to natural surface structures of cells and tissues, anchoring them securely to the glass surface. Due to this procedure, based on different binding principles, the cells do not lose their antigenicity, their cell functionality and their three-dimensional structure.

- Assays using only several hundred cells possible
- No cell loss even during harsh incubation procedures
- Excellent recovery rate
- Compatible with all standard and modern assay systems and all fluorescent dyes
- Particularly adapted to assays using stem cells

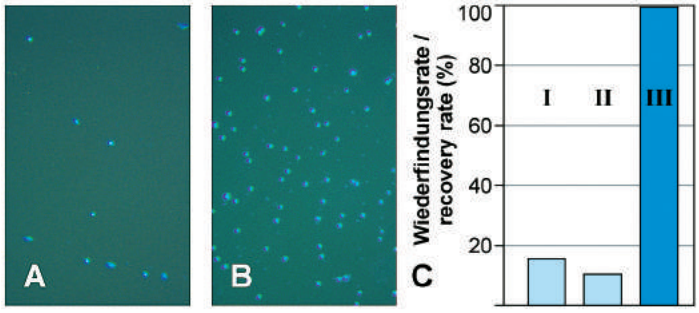

Figure:

Brand comparison of efficient cell immobilisation.
1800 murine myeloma cells in 30 µl PBS were applied to each slide. Cells were counted after full immunohistochemical assay including alkali treatment (70 mM NaOH, 150 mM NaCl, 40 % ethanol, 5 min, RT) and DAPI-counterstaining of the remaining nuclei.

A: Other adhesion slide,

B: Roti®-Bond Adhesion Slide,

C: Recovery rate in percent (I and II: other adhesion slides, III: Roti®-Bond)

Application:

Immobilisation of cells or tissue sections occurs immediately after contact to the glass surface. Drying of the samples is therefore not necessary. The cellular material can then be fixed with all common fixatives. Cell cultivation can be continued in appropriate culture medium after cell adhesion, allowing *in-vivo* live assays, e.g. with a multiphoton or laserscan microscope.

At present, there is no evidence of any preferential cell type binding in heterogenous cellular material.

Dimensions: L 75 mm x W 25 mm, thickness 1 mm

Roti®-Bond adhesion slides 50 and 100 are delivered in Rotilabo®-slide boxes.

Click Chemistry

The copper(I)-catalysed azide-alkyne cycloaddition (CuAAC) is the most prominent example of a group of reactions named click reactions. According to Sharpless' definition, these reactions are characterised by high yields, mild reaction conditions, and by their tolerance of a broad range of functional groups.[1-3] Typically, the reactions require simple or no workup or purification of the product. The most important characteristic of the CuAAC reaction is its unique bioorthogonality as neither azide nor terminal alkyne functional groups are generally present in natural systems.

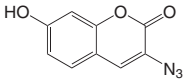
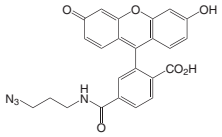
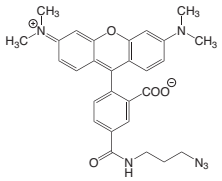
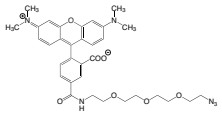
Fluorescent Tags









Roth offers a selection of fluorescent tags for labelling of (bio-)molecules via click chemistry. All available tags are suitable for fluorescence spectroscopy applications due to their excellent absorption properties and good solubility. Tags with PEG-spacer are beneficial for applications with as little interaction between the analyte and the tag as possible. The coumarine derivative (Art No. 7811) offers a unique feature: fluorescence is only detected after the coupling via click reaction.

Non-Fluorescent Tags

Besides fluorescent tags other non-fluorescent labels play an important role in biochemistry and microbiology. Incorporation of such functional groups into your sample with high yields and selectivity is easily possible by click chemistry. Further, the click reaction is compatible with or rather orthogonal to various other labelling methodologies. In order to enlarge the scope for your personalised application we offer these tags in azide and alkyne functional form.

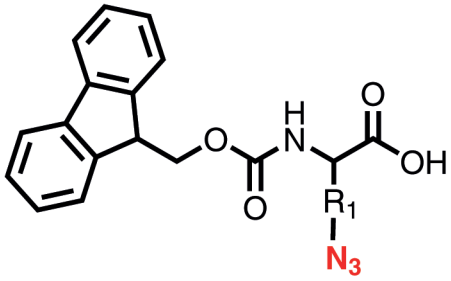
Azido Amino Acids



With the emergence of click chemistry the use of azide- and alkyne-derivatised α-amino acids has found high interest e.g. in the area of peptide synthesis as a powerful tool in the development of new therapeutics and biological chemistry fundamental research. Peptide labelling mostly requires reactions which are running close to physiological conditions (neutral pH, aqueous solution, ambient temperature).
Cu(I)-catalysed alkyne-azide cycloaddition (CuAAC) is optimal for such biological compounds, here the advantages of click chemistry once again show their potential. The low reactant concentrations, low background labelling, the quantitative and rapid labelling, plus the mild reaction conditions fit the necessary reactivity, selectivity and biocompatibility criteria for the peptide labelling and thus ensure the preservation of biological function.
Roth provides high quality azido amino acids. In this form they can easily undergo click reaction when an alkyne functional reporter molecule is present.

Nucleosides and Nucleotides

Nucleosides

The detection of cell proliferation is of utmost importance for monitoring cell vitality, determining genotoxicity or evaluating anticancer drugs. The feeding of cells with EdU (5-Ethynyl-2'-deoxyuridine) or EU (5-Ethynyl uridine) can be used in cell proliferation studies.

Nucleotides

Our modified nucleotides for click chemistry complement our range of unmodified standard nucleotides. You can use our alkyne-triphosphates in your nucleotide mixture to incorporate alkyne groups into your PCR fragment. These alkyne groups can be used to label the PCR fragment in a subsequent click reaction.

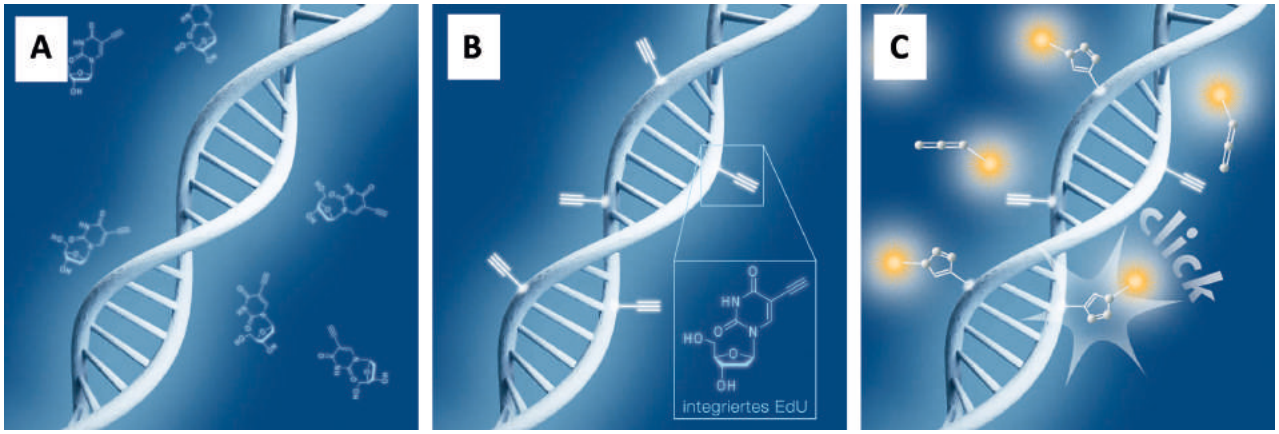
Important information on refrigerated transports



All products identified as being particularly temperature-sensitive are shipped in **special ice boxes with freezer packs or in dry ice.**
Additional costs resulting from such, **will be invoiced** (further information on request).

Please note:
In order to guarantee optimum product quality, the dispatch of refrigerated transport products will be carried out **on Mon and Tue only outside Germany!**
Slight delays in delivery are therefore possible.

Cell Proliferation Assays

Our ROTI®Kits for EdU mediated detection of cell proliferation provide a superior alternative to time-consuming and less sensitive bromodeoxyuridine (BrdU) assays. Similar to BrdU assays, our assays utilise a uracil derivative (in this case ethynyldeoxyuridine, EdU) which is incorporated into the replicating DNA.
EdU is not detected via antibodies; instead fluorescent dyes are coupled directly via click reaction.
This fast and elegant approach allows direct labelling of replicating DNA with the desired fluorescent dye.
Thus, the assay is perfectly adaptable to the present facilities and to the assay situation (e.g. for double or triple detection). Furthermore, the click reaction is highly selective and therefore prevents any unspecific labelling.
The protocol includes only few steps and decreases the total amount of time.

Advantages of the click chemistry based approach:

Schematic illustration of the click chemistry based EdU cell proliferation assay. A) Incubation of cells with EdU. EdU is a thymidine analogue and is incorporated in DNA during active DNA synthesis. B) After DNA synthesis, EdU was incorporated in the DNA strands. C) Detection of proliferating cells via click chemistry. This reaction is finished within 30 minutes, whereby a variety of different fluorescent dye azides can be used.

Benefits of the Click Assay:

- Highly reliable
- Easy handling
- Fast detection procedure (only 30 min)
- Mild conditions, no DNA denaturation required
- Compatible with various dyes
- Modular system in click chemistry
- Compatible with multiplexing

ROTI®kits for Imaging

The detection of cell proliferation is of utmost importance for monitoring of cell vitality, determining genotoxicity or evaluating anticancer drugs. Roth's cell proliferation assays based on EdU (5-ethynyl-2'-deoxyuridine) provide a superior alternative to BrdU (bromodeoxyuridine) assays. Roth's EdU Click assays are not antibody based and therefore do not require DNA denaturation for detection of the incorporated nucleoside. Instead, the EdU Click assay utilises click chemistry for detection in a variety of dye fluorescent readouts. Furthermore, the streamlined detection protocol both reduces the total number of steps and significantly decreases the total amount of time.

Proliferating tissue of barley meristem labeled via EdU Click-555 kit (Art. Nr. 7775.1). Dividing cells incorporated EdU and were labeled via click reaction with TAMRA (pink stained cells). Nuclei were counterstained with DAPI (blue). Magnification: 100x; Filterset: Sp. Aqua HC mFISH; Sp. Green HC mFISH

ROTI®kits for Flow Cytometry (FC)

The ROTI®kits for Flow Cytometry by Roth use click chemistry to detect cell proliferation by means of a large number of fluorescent stain read-outs. In the detection procedure both, the total number of steps and the processing time are significantly reduced. The simple click chemistry detection procedure is complete within 30 minutes.

ROTI®kits for High Throughput Screening (HTS)

The ROTI®kits for High Throughput Screening measures DNA synthesis of adherent cells in 96 well plates. By utilising click chemistry, detection of a variety of fluorescent dyes is highly specific and very fast. The kits are available in different sizes. The size (2, 4 or 20) refers to the number of 96-well plates for which the kit is designed.

HeLa cells incubated without and with 10 µM EdU for 2, 4 or 6 h in 96 well plate. EdU incorporation was detected over time and for different cell numbers using a fluorescence plate reader. Control: Without EdU no fluorescence was detected after 6 h incubation time.

Fluorescence imaging of 2 wells:
Well C9 incubated for 6 h with EdU;
Well G9: Incubation without EdU.

CPG/Supports

Support material for DNA-Synthesis

Derivated Controlled Pore Glass (CPG) is used as support material for DNA-synthesis.
The 500 Å supports are ideal for virtually all applications. In order to avoid steric hindrance between the growing oligo-nucleotide chains and to gain a maximum yield of full-length chains, a long-chained alkylamine "spacer arm" is used.

500 Å supports are loaded with 30-40 µmol/g

Solvents for DNA Synthesis

- Each reagent is specially purified for DNA synthesis
- Each batch is tested on a synthesizer to determine maximum yield
- Extremely careful manufacturing, testing and packing guarantee a new standard of quality - the DNA Synthesis Grade

Acetonitrile

ROTISOLV® ≥99,9 %, for DNA synthesis

Water content ≤10 ppm

Danger H225-H302+H312+H332-H319

For solubilisation of phosphoamidites during synthesis of oligonucleotides >20mer.

Guarantee analysis:

Assay (GC).....≥99,9 %
Water (KF).....≤0,001 %
Non volatile matter.....≤0,0001 %

Acetonitrile

ROTISOLV® ≥99,9 %, for DNA synthesis

Water content ≤30 ppm

Danger H225-H302+H312+H332-H319

For solubilisation of phosphoamidites during synthesis of oligonucleotides ≤20mer.

Guarantee analysis:

Assay (GC).....≥99,9 %
Water (KF).....≤0,003 %
Free acid.....≤0,002 %
Non volatile matter.....≤0,0003 %

Acetonitrile

ROTISOLV® ≥99,9 %, for DNA synthesis

Water content ≤30 ppm

Danger H225-H302+H312+H332-H319

For solubilisation of phosphoamidites during synthesis of oligonucleotides ≤20mer. Sealed with septum cap.

Guarantee analysis:

Assay (GC).....≥99,9 %
Water (KF).....≤0,003 %
Packed for Applied Biosystems and Biosearch DNA-Synthesizer.

3620.1	100 ml	septum bottle	30,00 €

Ammonia solution 32 %

30-33 %, for DNA synthesis.

Storage temp.: +4 °C

Danger H290-H314-H400-H335

For oligo separation from supports and for neutralising protective groups. Comes in bottle to fit ABI 391/392/394.

Type analysis:

Assay (NH_3).....≥30 %

A990.1	200 ml	glass	18,85 €

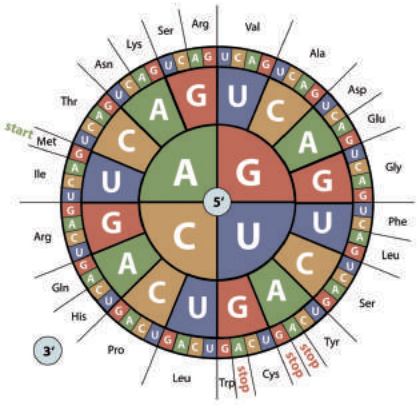
Acetonitrile

ROTIDRY® ≥99,9 % (≤10 ppm H_2O)

Dried; for DNA synthesis and analysis.

Danger H225-H302+H312+H332-H319

Guarantee analysis:



Assay (GC).....≥99,9 %
Colour (Hazen).....≤10
Water (KF).....≤0,001 %
Acidity.....≤0,0005 meq/g
Evaporation residue.....≤0,0005 %

Amino acids

Our amino acids are of the highest purity and suitable for a broad range of applications in biochemistry. Besides the natural occurring L-amino acids, we offer a selection of unnatural D-amino acids and DL-amino acids.

Isotope Labelled Amino Acids (SILAC)

Stable Isotope Labelling with Amino Acids in Cell Culture (SILAC) is a metabolic labelling technique for mass spectrometric (MS)-based quantitative proteomics. For this purpose originally identical cell cultures are cultivated with different nutrient media. One of the cell populations is fed with growth medium containing unlabelled amino acids. In contrast, the second cell culture is fed with a medium containing one or two amino acids labelled with stable (non-radioactive) heavy isotopes. For example, the medium may contain arginine labelled with ^{13}C carbon instead of the normal ^{12}C carbon. The cells growing in this medium incorporate the heavy arginine into all their proteins. Then all peptides containing a single arginine are 6 Dalton heavier than their normal counterparts. The proteins from both cell populations are then mixed together in a ratio of 1:1 and analysed by mass spectroscopy. Pairs of chemically identical peptides of different isotopic compositions can be distinguished in a mass spectrometer on the basis of their mass difference. The ratio of the intensities in the mass spectrum for such peptide pairs reflects the frequency ratio for the two proteins.

PEPTIPURE® Reagents

Our Brand for Peptide Synthesis

Peptide synthesis reagents must meet very high requirements to ensure that no by-products are produced during peptide synthesis and that very high yields can be achieved. Under the brand name PEPTIPURE® you will find all reagents that are especially suitable for peptide synthesis.

Protected Amino Acids

We supply protected amino acids of the highest quality and purity for standard applications in biochemistry and specifically for peptide synthesis.

Tip:

- There is no single coupling reagent that is suitable for every coupling reaction. Therefore, Roth offers a broad range of established and reactive coupling reagents.
- Besides the "gold standard" HATU (Art. No. 2131), we also offer the greener alternative COMU® (Art. No. 2100), which is known to mediate the coupling in most cases at least as efficient as HATU.
- Oxyma Pure (Art. No. 2118) and K-Oxyma (Art. No. 6891) were developed as less hazardous alternatives for HOBt and HOAt, thus being a perfect one-to-one replacement in most syntheses.

Tip:
A well-known method for protein sequencing is the Edman degradation. Herein, the peptide is degraded using **phenyl isothiocyanate (Art.No. 7296)** starting from the N-terminus. Phenylisothiocyanate reacts with the N-terminal amino acid resulting in cleavage from the peptide and formation of a phenylthiohydantoin derivative. Subsequently, the phenylthiohydantoin derivative is identified by chromatographic methods through comparison with standards and the next amino acid can be addressed. Through repetition of this procedure stepwise degradation of the peptide is achieved, thus enabling sequencing of peptides with up to 50 residues.

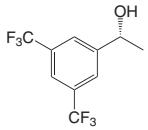
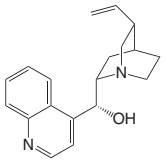
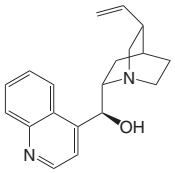
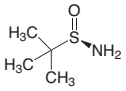
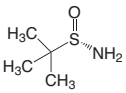
Phosphine Ligands

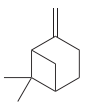


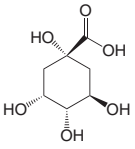


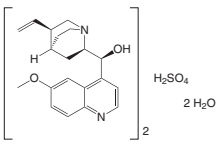


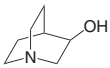


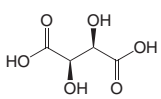


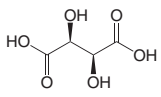












Transition metal-catalysed cross-couping reactions are an efficient method for linking new C-C, C-N and C-O bonds in the organic synthesis. Ligands, particularly phosphine ligands, play a key role in the stabilization and activation of metal lions in the transition metal complexes. The correct selection of the phosphine ligands can change important factors such as the reactivity and lifetime of the catalyst, the electron density at the metal atom and also the sterical properties of the catalyst. When using chiral phosphine ligands, it is also possible to achieve enantioselectivity of a reaction.

Protecting Groups

Today, protecting groups have become an important tool in the multi-stage, organic synthesis of complex compounds. The task of a protecting group is to protect a functional group from undesirable reactions with other functional groups. Then the protecting groups should be separated again under as mild as possible conditions. Good protecting groups should be specific, highly selective and both introduceable and separable in high yields, and stable under as many reaction conditions as possible.

Oxidising Agents

Oxidation reactions play an important role - not only in inorganic chemistry but also in many organic synthesis processes. Several examples are shown here: Lemieux-von Rudloff oxidation, Lemieux Johnson oxidation and dihydroxylation. Roth offers a selection of well-known and commonly available oxidants in this area.

(Lewis) Acids

Acids are commonly used in synthesis protocols for processing reactions. In addition, acids (usually Lewis acids) can also serve as catalysts for various reactions. The removal of the Boc protecting group shown here is formally catalysed by the acids used (in this case, trifluoroacetic acid). In addition to conventional inorganic acids, Roth can supply other acids and Lewis acids commonly used in organic synthesis.

Bases

Many reaction mechanisms require deprotonation so that the desired reaction can take place. The strength of the required bases depends entirely on the application. Roth supplies a wide selection of bases which play an important role in organic synthesis.

Quaternary Ammonium Compounds

Quaternary ammonium compounds are organic ammonium compounds, for which all four valences of a nitrogen atom are connected organically. These ammonium compounds are often used as phase-transfer catalysts and ion pair reagents.

Solvents

ROTIDRY® Dried Solvents

Due to their very low water content, ROTIDRY® solvents are ideal for organic synthesis, DNA synthesis and analysis.

ROTIDRY® solvents can be used wherever a low water content is important, for example in chromatographic purification methods.

Properties:
- Very low water content
- Extremely high product purity
- Low evaporation residue
- Filled under inert gas
- Particle filtration

Example Specification:

Acetonitrile
ROTIDRY® ≥99,9 % (≤10 ppm H_2O)
Dried; for DNA synthesis and analysis.

Danger H225-H302+H312+H332-H319

Guarantee analysis:
Assay (GC).....≥99,9 %
Colour (Hazen).....≤10
Water (KF).....≤0,001 %
Acidity.....≤0,0005 meq/g
Evaporation residue.....≤0,0005 %
Filtered through a membrane and filled under protective gas.

ROTIDRY® Sept Dried Solvents in Septum Bottle

Advantages of the septum bottle:
- Additional product quality assurance
- No ingress of water during removal
- Ideal for small quantities
- Removable septum for removal of large quantities
- Special cap permits multiple puncture points

Example Specification:

Acetonitrile
ROTIDRY®Sept ≥99,9 % (≤10 ppm H_2O)

Ionic Liquids

Ionic liquids are salts which are available in a liquid state over a wide temperature range. They constitute a new generation of solvents with considerable potential for being able to replace classic organic solvents. Ionic liquids are composed of organic cations and organic or anorganic anions. Due to their fully ionized composition they exhibit no vapor pressure over the entire liquid range.

- Low-melting with melting point under 100 °C
- Thermally, mechanically and electrochemically stable
- Neither volatile nor combustible
- Negligible vapor pressure
- High solubility of many different kinds of chemicals

SOLVAGREEN® – Green Solvents
Our Brand for Alternative Solvents

The listed sustainable - Green Solvents - serve as an alternative for environmentally hazardous and harmful reagents, and thus contribute to risk minimization.

Sustainability is also achieved through the use of renewable resources or environmentally compatible manufacturing and recycling processes.

Bioethanol

Our bioethanol is manufactured by fermentation of organic wheat followed by distillation and rectification.

Advantages:
- Made from wheat grown in a controlled organic environment in accordance with EU organic farming regulation 834/2007
- Non-synthetically manufactured ethanol
- Low toxicity thanks to safe production methods
- Suitable for synthesis and other laboratory applications
- Denaturated using a non-organic denaturant (Art. No. 6726)

Acetals

Acetals are produced from an alcohol and an aldehyde. They form an extremely stable chemical family with linear or cyclic structures.

Roth offers a range of acetals with various properties. Acetals range from immiscible with water to extremely miscible; all acetals can be easily mixed with organic solvents.

Acetals have strong dissolving properties which allow them to dissolve many substances.

Areas of application:
- In place of hazardous solvents
- Cleaning
- Synthesis

Consumer notice:
Not every alternative solvent is suitable for every application.
Roth offers a wide range of alternative solvents in order to address a large variety of solvent problems. Acetals can also be used as additives for normal, classic solvents.

NMR-Spectroscopy
Deuterated Compounds

Deuterated reagents are used primarily in NMR spectroscopy.
Examples of application: Routine tasks such as structure determination and identity verfication in research and development laboratories.

- High degree of deuteration
- Defined water content
- Extremely cost effective

Reference Standards

The reference standards are offered as powders with good flowability and crystallinity to guarantee efficient handling in the laboratory. All products of this product line are filled in brown glass vials with screw caps and are packed in foil bags. This packaging enables safe long term storage as well as protection of the product against external influences. Hence, the storage environment is controlled.

Primary Standards

ROTI®Star Primary Standards for Pharmaceutical and Food Analysis

ROTI®Star Primary Standards are extensively characterised by the analytical methods listed below.

They come with a certificate which contains:
- Proof of identity with spectra, e.g. ^{1}H NMR, ^{13}C NMR, MS, UV
- Content determined with two independent validated methods, e.g. chromatographic purity and quantitative NMR (qNMR)
- Content of residual solvent determined with two different validated GC methods
- Water determination by Karl Fischer titration

Working Standards

ROTICHROM® Working Standards for Analysis

The ROTICHROM® Working Standards are traceable to established primary standards which are characte-rised extensively regarding identity and content. Therefore, they can be used in all areas of analytics and are a cost-saving alternative to primary standards.The standard comes with a certificate of analysis including proof of identity and defined assay. The substances are protected optimally against external influences with a high-quality glass and foil bag packaging.

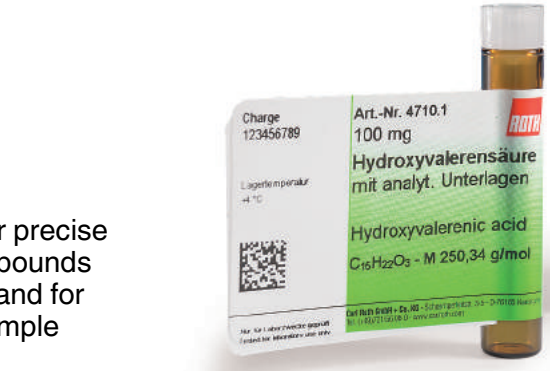
Reference Substances ROTICHROM® HPLC/TLC/GC



for Chromatography

Pure reference substances are essential for precise analysis. They are used for identifying compounds by retention time, for calibrating detectors, and for eliminating errors in quantification of the sample compounds.

In all chromatographic methods peak areas are proportional to sample quantity. For precise quantitative analysis, however, it is necessary to calibrate the detector as the signal may significantly vary with different substances.

To avoid errors during sample preparation and injection, an internal standard should be used in any case. The standard must not be present in the sample, however, its chemical and physical properties ought to be the closest possible to the analytical targets. It must be well resolved in the chromatogram within the same range of retention time as the analyte of interest. The internal standard is added prior to sample preparation and thus passes through all the steps of the analysis.

By reference to its peak area, sample losses during preparation and injection can be compensated.

Reference Substances with Analytical Documentation

TLC, HPLC, ^{1}H NMR, ^{13}C NMR, UV, IR, MS

The high-purity substances from this product line are supplied with extensive analytical documentation. This documentation extends to approx. 20 pages and contains all key data on the analytical methods used. Our results are generally confirmed using at least one additional method. This ensures maximum reliability in assay and identity testing.

Reference substances

- ROTICHROM® HPLC
- ROTICHROM® TLC
- ROTICHROM® GC

are supplied with an HPLC chromatogram, TLC chromatogram and GC chromatogram respectively, which is enclosed in the covering box.

Reference Substances for HPLC

ROTICHROM® HPLC

Roth offers a broad range of reference substances for HPLC. These highly pure substances predominantly have a high HPLC purity, which allows a meaningful analysis. You will find the certificate of analysis with a HPLC chromatogram in the outer packaging.

ROTICHROM® HPLC - first choice for reference substances for chromatography.

Reference Substances for GC

ROTICHROM® GC

Roth offers an extensive range of reference substances for gas chromatography from the substance groups of alkanes, alcohols, ketones, esters, aromatic compounds, and many more. Their GC purity allows an accurate analysis.

The **ROTICHROM® GC** substances come with a certificate of analysis and a GC chromatogram enclosed in the outer packaging.

Fatty Acid References

In the field of lipid analysis we provide an extensive collection of reference substances and reference mixtures at the analyst's disposal.

All reference mixtures are prepared from pure components which are carefully tested for purity by TLC and GC.

Precise weighing and a final check guarantee the precision of the mixture. A certificate comes with each product.

ROTH BUCH

Atlas of oil plants and vegetable oils

L. Roth, K. Kormann
Edition 2005, 196 pp., hardcover
ISBN-10: 3-86037-290-4

This is a unique source of information on the world's over 50 individual oilseeds including major, minor, unexploited and non-edible oilcrops. Each crop is clearly presented in a portrait of the plant (botany, distribution, cultivation) including colour pictures, tabular data on nutritional composition and oil characteristics. The book discusses the composition, processing technologies and utilization in the processing of oilseeds into oil, protein products and other by-products.

Essential oils

Essential oils are produced in the oil glands of plants and are stored in various plant tissues. They can be found in blossoms, leaves, seeds, husks, roots, resins and bark or in the wood of a plant. Essential oils are generally extracted from plant components by steam distillation.

Our essential oils are carefully manufactured from selected raw materials. Our **Natural oils** are composed of 80 % mother plant extracts. **Artificial oils** are manufactured from synthetic aromatic substances.
The origin of the plant is specified via the country code.

Carbohydrates

Carbohydrates or **Saccharides** make 50 % of the dry biomass of the earth and therefore are the most frequent class of biomolecules. Besides at least two hydroxy groups, they also have an aldehyde or a ketone group and can be subdivided according to the number of monomeric components in mono-, di-, oligo and polysaccharides.

Mono-, di- and oligosaccharides are soluble in water, taste sweet and hence are called sugar, whereas polysaccharides are hardly, if not at all, soluble in water and have a neutral taste.

Carbohydrates, together with fats and proteins make up a large percentage of nutrition. In addition to their central role as an energy source, they are also an important structural component especially in plants (e.g. cellulose). Ribose, a monosaccaride with five carbons ($C_5H_{10}O_5$) is an essential element of coenzymes (such as ATP, FAD and NAD) and a structural component of RNA. Desoxyribose (a ribose derivative) is a structural component of DNA.

Monosaccharides

Monosaccharides are the simplest carbohydrates that cannot be hydrolysed further. They consist of one sugar unit (monosaccharide). The general formula for unmodified monosaccharides is $C_n(H_2O)_m$. The most important representatives of monosaccharides are glucose and fructose.

Disaccharides

Disaccharides consist of two monosaccharide units. These are interlinked covalently via a glycosidic bond. The most familiar representatives are saccharose, lactose and maltose.

Oligo- and Polysaccharides

Oligosaccharides consist of three to nine monosaccharide units.

Polysaccharides are macromolecular substances that consist of ≥10 monosaccharide units. A distinction is made between homoglycans, which are made up of only one type of monosaccharides (e.g. starch) and heteroglycans, which consist of at least two different monomeric components (e.g. xanthan).

Dextrans

Dextrans are highly branched macromolecular biopolysaccharides.
They consist exclusively of glucose monomers and belong to the homoglycans.
Natural dextrans have molecular masses between 10 and 50,000 kg/mol.

Dextrans are soluble in water, whereby the solubility depends on the molecular mass. Here, highly viscous, gel-like liquids are formed. Due to the very broad molecular mass distribution of the various dextrans and the associated differences in terms of solubility in water, dextrans have numerous applications.

Thanks to their special properties, dextrans play an important role in many areas. For instance, dextrans are used in chromatography, both as a carrier in affinity chromatography and (in a modified form) for Gel Permeation Chromatography (GPC). Furthermore, they are used as a measurement standard in membrane technology and in adhesives as well as coatings, or as an auxiliary material for paper and textile manufacture.

ROTI®Cap High Performance Capillary Columns

Made in Germany

The Roth series of high performance capillary columns for gas chromatography, ROTI®Cap are well established and set standards:

Low column bleed
Modern manufacturing processes offer capillaries with lower bleed levels, which are especially suitable for GC-MS. Less column bleed yields increased sensitivity and accuracy through a better signal to noise ratio for any kind of detector. Further reduced column bleed improves detectability of analytes in qualitative and quantitative GC-MS analysis.

High thermal stability
Due to high temperature stability ROTI®Cap capillary columns can be operated at about 40 °C higher temperatures compared to standard phases. Thanks to these elevated working temperatures, high-boiling components, which exhibit very long retention times and wide peaks on standard phases, elute earlier and show a better peak shape.

High inert columns due to optimised deactivation
Polar compounds are often difficult to analyse because they are prone to tailing. Advances in deactivation technology for the ROTI®Cap capillary columns result in an excellent chromatographic performance yielding improved peak shapes of polar compounds combined with improved efficiency and sensitivity.

In order to guarantee best industry standard capillaries with highest reproducibility from column to column ROTI®Cap capillary columns have to meet high specifications.
Within the **quality control** the following parameters are determined:
- **Separation Efficiency** by measuring the separation number (acc. to Kaiser) in a temperature programme
- **Polarity** by measuring retention indices
- **Bleeding** in a temperature programme with a test mixture including high-boiling hydrocarbons
- **Inertness** by measuring the peak height ratio for decylamine/C12 (for non-polar to medium polar phases)

GC capillary column ROTI®Cap-1

100 % Dimethylpolysiloxane

- **Non-polar**
- Solvent rinsing applicable
- **Working temperature limits:**
  for columns with 0,10 - 0,32 mm inner diameter and films <3 µm:
  340 °C for isothermal operation
  360 °C for short isotherms in a temperature programme
  for columns with 0,53 mm inner diameter and films <3 µm:
  320 °C for isothermal operation
  340 °C for short isotherms in a temperature programme
  for thick film columns with films >3 µm:
  300 °C for isothermal operation
  320 °C for short isotherms in a temperature programme
- **Application areas:** Excellent column for routine applications.

- **Similar phases:** OV-1, DB-1, SE-30, HP-1, SPB®-1, CP-SIL 5 CB, Rtx®-1, Quadrex 007-1, BP1, MDN-1, AT™-1, ZB-1, OV-101
- Equivalent to USP phases G1/G2/G38

GC capillary column ROTI®Cap-5 MS Ultra

Silarylene Phase

- **Non-polar**
- Polarity similar to a **5 % diphenyl - 95 % dimethylpolypropylene phase**
- **Extremely low column bleed**
- Solvent rinsing applicable for removing impurities
- **Working temperature limits:**
  340 °C for isothermal runs
  360 °C for short isothermal runs in a temperature programme
  for columns with film thickness >0,5 µm:
  320 °C for isothermal runs
  340 °C for short isothermal runs in a temerature programme
- **Application areas:** all-round phase for environmental analysis, trace analysis, EPA methods, pesticides, PCBs, food and drug analysis. Ideal for ion trap and quadrupol analyzers.

- **Similar phases:** DB-5 MS, HP-5 MS, Ultra-2, Equity™-5, CP-SIL 8 CB low bleed/MS, Rtx®-5SIL-MS, Rtx®-5 MS, Rxi®-5 MS, Quadrex 007-5 MS, BPX-5, MDN-5S, AT™-5 MS, VF-5 MS
- Equivalent to USP phases G27/G36

The bleed comparison test of the **ROTI®Cap-5 MS Ultra** with a conventional 5 phase and 5-MS phase shows the outstanding performance of the silarylene phase.

GC capillary column ROTI®Cap-5 HT

Silarylene Phase

- **Non-polar**
- Selectivity similar to a **5 % diphenyl - 95 % dimethylpolysiloxane phase**
- Low column bleed
- Solvent rinsing applicable
- **Working temperature limits:**
  380 °C for isothermal operation
  400 °C for short isothermal operation in a temperature programme
- **Application areas:** simulated distillation, hydrocarbon, fuel, oil analysis, high boiling analytes, ideal for MS detectors

- **Similar phases:** DB-5HT, VF-5HT, HT-5, XTI-5HT, ZB-5HT
- Equivalent to USP phases G27/G36

GC capillary column ROTI®Cap-XLB

Silarylene phase with optimised silarylene content
for lowest column bleed. Recommended for the separation of PCBs.

- **Non-polar**
- Very low column bleed
- **Working temperature limits:**
  340 °C for isothermic operation
  360 °C for short isothermes in a temperature programme
- Ideal for ion trap and quadrupol analyzers
- Perfect inertness for basic compounds
- Solvent rinsing applicable for removing impurities
- **Application areas:** highly selective for environmental and trace analyses, pesticides

- **Similar phases:** DB-XLB, Rtx®-XLB, Rxi®-XLB, MDN-12, VF-XMS

Injection Port Septa

Advantages:
- Produced individually using injection moulding procedure
- CenterGuideTM for centred needle guidance and thus perfect fit
- Temperature stability up to 400 °C, Shimadzu plug septa up to 300 °C
- Precision indentations for perfect seat
- Special coating for easy replacement without fixed jaw on the injector
- Septa thickness: 3 mm
- Blister pack for clean and immediately usable septa

Derivatisation Reagents for GC

Derivatisation reagents are mainly used in gas chromatography when adequate volatility or stability of the substances to be separated is required. Detection sensitivity can also be increased through derivatisation. Our range of derivatisation reagents is ideal for acylation, alkylation and silylation of reagents.

Septum bottle: Aluminium seal with PTFE-lined rubber disc (septum). The pierced septum is no longer absolutely air-tight. Therefore, we suggest to use up the content as quickly as possible and keep the vial standing upright. Otherwise the reagents come in contact with the rubber which can cause contamination to the point of making them useless.

Solvent for MOSH/MOAH analysis

For identifying saturated and petroleum-derived aromatic hydrocarbons.

The analysis and quantitative identification of MOSH/MOAH constituents is performed as a sum parameter. The sample is extracted using n-hexane and verified using coupled liquid chromatography-gas chromatography.

ROTISOLV® GC Ultra Grade Solvents

for gas chromatographic and residue analysis

In order to monitor and analyse environmentally relevant substances such as pesticides, dioxins, furans, PAHs, PCBs etc. in trace analysis, solvents with exceedingly high purity specifications are required. Roth's ROTISOLV® GC Ultra Grade solvents have been developed specially for this application area and are produced with the most sophisticated production processes. Extensive quality checks guarantee the same high-grade quality from batch to batch.

Features:
- Highest purity
- Very low water content
- Non-volatile matter: less than 2 ppm
- Quality control by means of ECD and PND
- PAH-test
- Filtered through 0,2 µm membrane
- Bottled under protective gas

ROTISOLV®
Pestilyse® plus Solvents

for determination of dioxines, furanes, PCBs, pesticides, hydrocarbons and further pollutants

Roth created this product line (ROTISOLV® Pestilyse® plus) especially to address the growing requirements in residue analysis. Several relevant parameters are specified for these solvents which allow the use in various applications. With this product line, Roth sets the benchmark for residue analysis solvents in terms of purity and quality.

Features:
- Highest purity
- Controlled by FID, ECD and PND
- PAH tested
- Tested for hydrocarbons (C_{14}-C_{40})
- Tested for fluorescence
- Volatile impurities: max. 5 ppm
- Non-volatile impurities: max. 5 ppm

ROTISOLV®
Pestilyse® Solvents

for residue and environmental analysis

Field of application: Residue Analysis of Pesticide (via ECD, PND detection) in sectors environment, foodstuff, water, etc.
ROTISOLV® Pestilyse® solvents are ideal as extraction agents and for sample preparation.

Advantage:
- Highest purity
- Quality control via ECD and PND
- Non-volatile impurities: 5 ppm or less
- Specially purified for application in pesticide residue analysis

ROTISOLV® Headspace Grade Solvents

for analysis of organic volatile impurities (O.V.I.)

Headspace gas chromatography is a major quality control procedure particularly in the pharmaceutical and food industry. The regulations for this method can be found both in the European as well as the American Pharmacopoeia.
High-boiling solvents of excellent purity, which show no background due to organic volatile impurities on the GC-column, are required for determining solvent residue.

Advantage:
- Highest purity (mostly ≥99,99 %)
- High boiling point
- Non volatile matter: ≤0,001 %
- Tested for headspace suitability
- Bottled under protective gas
- Microfiltered

Thin-Layer Chromatography

Although the principle of thin-layer chromatography (TLC) is more than a century old, it did not make its breakthrough as an analytical method until about 50 years ago.
Thanks to the development of new sorbents, supports and the possibility of automation, TLC has become a versatile separation method. It is used for both qualitative and quantitative analysis.
Applications range from simple manual separation processes in classic TLC to automated processes in HPTLC (high performance thin-layer chromatography).

Advantages of thin layer chromatography:
- Higher sample throughput in less time
- Suitable for screening tests
- The ready-to-use TLC layer functions as a data storage device for separation results
- Pilot process for HPLC
- The separated substances can later be used for further analysis (e.g. IR, MS)
- By switching the mobile and the stationary phases, the separation process can be optimised quickly and cost-effectively

ADAMANT TLC Plates with Standard Silica Gel

Silica gel 60
With improved binder system and optimised grain distribution.

- Spec. surface: approx. 500 m^2/g
- Medium pore width: 60 Å
- Spec. pore volume: 0,75 ml/g
- Particle size: 5-17 µm

Adamant TLC plates are unique for their:
- Outstanding hardness and abrasion resistance due to an optimised binder system
- Increased separation efficiency due to an optimised particle size distribution
- High suitability for trace analysis resulting from a UV indicator with increased brilliance and a low noise background of the layer

- Spec. surface: approx. 500 m^2/g
- Medium pore width: 60 Å
- Spec. pore volume: 0,75 ml/g
- Particle size: 5-17 µm

The ready-to-use foils are produced with a special, highly polymeric binder, which is resistant towards almost all organic solvents and aggressive visualisation reagents. It is also completely stable in pure aqueous eluents.

- Easy cutting of foils, **no flaking of silica**
- Outstanding wettability, precise colourisation even with 100 % aqueous eluents
- Excellent separation efficiency and reproducibility from lot to lot

Nano silica gel
- Spec. surface: approx. 500 m^2/g
- Medium pore width: 60 Å
- Spec. pore volume: 0,75 ml/g
- Particle size: 2-10 µm

Advantages compared to standard plates:
- Higher separation effect
- Shorter separation times and distances
- Smaller sample amounts of 0,01-0,1 µl (10-100 nanolitre)
- Lower diffusion due to extremely small amounts
- Higher detection sensitivity

Diol-modified HPTLC Silica Layers

Diol modification, carbon content 5,5 %
- pH stability 2-8
- Layer can be equally well wetted by pure water and organic solvents

Order of polarity:
Silica > **DIOL** > NH_2 > CN > RP-2 > RP-18 W

Recommended application: steroids, pesticides and plant constituents; for critical separations an alternative to silica, since it is less sensitive to the water content of the environment; leads to more reproducible results compared to silica.

Silica Gel 60 for TLC

Silica gels are the most important base material for thin-layer chromatography. Therefore, we offer a range of specially selected silica gels 60 for preparing your own TLC plates. Our programme ranges from G-types (with gypsum) to a P-type (for preparative applications).

- Spec. surface: ~400-500 m²/g
- Mean pore width: 60 Å
- Pore volume: ~0,8 ml/g
- Particle size: 0-20 µm or 0-40 µm (preparative)
- Loss on drying: <9 %
- pH-value (5 % suspension): ~7

Coating of TLC plates with Silica Gel G: TIP

Suspend 25 g Silica Gel G in 50 ml distilled water under frequent agitation.
The fluid suspension will harden after a short time, due to the amount of gypsum, and can immediately be applied to a glass plate that is free of grease.
The plates should be rested for about 10 minutes until the surface is completely dim.
Afterwards, preferably after predrying the plates exposed to air overnight, the plates are dried (activated) for 30 minutes at 105 - 110 °C in a drying cabinet.

The plates should be stored in a desiccator above a desiccant like Silica Gel Orange (Art. No. P077) until usage.

TLC Spray Solutions

Roth's ready-to-use spray solutions make thin-layer chromatography operations considerably easier. For these ready-to-use spray solutions the staining/derivative reagent was dissolved in ethanol, 2-propanol or water.

Aniline phthalate spray solution

Ammonium molybdate spray reagent:
for detecting hydroxycarboxylic acids.
Mix 2 ml **ammonium molybdate solution** 25 % + 2 ml ascorbic acid 10 % + 2 ml sulphuric acid 29,5 % and add 4 ml H_2O.

Dragendorff's spray reagent:
for detecting tertiary amines and nitrogen heterocycles.
Mix 0,85 g **bismuth(III) nitrate basic** + 40 ml H_2O + 10 ml acetic acid with 20 ml KI-solution (40 %).

Bromcresol green spray reagent:
for detecting hydroxycarboxylic acids.
Dilute 25 mg **bromcresol green** + 0,36 ml 0,1 N NaOH + 10 ml ethanol 96 % to 50 ml with H_2O.

Ehrlich's spray reagent:
for detecting sulphonamides and primary aromatic amines.
Mix 0,5 g **4-(dimethylamino)-benzaldehyde** + 25 ml hydrochloric acid 36 % + 25 ml ethanol 96 %.

Natural product reagent A as a spray reagent:
According to Wagner natural product reagent A is an excellent reagent for fluorometry to quantitate thin-layer chomatograms.
Application:
Natural product-polyethylene glycol reagent (NST/PEG). Spray a 1 % methanol solution of natural product reagent A and a 5 % ethanol PEG 4000 solution, one after the other onto the TLC plate (approx. 10 ml and 8 ml). Intensive fluorescent colours will appear immediately or after 15 min in UV-365 nm. Adding PEG will lead to an increase in detection sensitivity (from 10 µg to 2,5 µg).
The fluorescence behaviour depends on the constitution. The reagent must be freshly prepared before use (1 % in methanol). Spray under the fume hood!

Ninhydrin spray reagent:
for detecting amino acids and primary aliphatic amines.
0,15 g **ninhydrin** + 47,5 ml 2-propanol + 2,5 ml acetic acid 96 %.

TLC sprayer

Versatile sprayer with gas cartridge for spraying reagents and other liquids. Spray pressure: constant 4,4 bar. Eco-friendly propellant mixture of dimethyl ether, propane and isobutane.
Sufficient for approx. 500 ml of liquid.
Easy to clean: unscrew cartridge, immerse uptake into vessel containing cleaning fluid and spray until the spray is free of residues.

Propellants: dimethyl ether, isobutane, propane.

Delivery incl. propellant cartridge (55 g or 94 ml), 170 ml glass reservoir bottle, suction tube and screw cap.

Paper Chromatography

Paper chromatography is the oldest chromatographic technique. Like other chromatographic applications, separation is based upon the partition of the material mixture, which is to be separated, between two immiscible phases.
While the chromatographic paper is, strictly speaking, only the carrier for the liquid mobile phase, the properties of the paper do, in fact, have considerable influence on the quality of the separation.
The most important characteristics of chromatographic papers are the **weight** (g/m²), the **thickness** (mm) and the **migration distance.**
When specifying the migration distance, it is common practice in the paper industry to apply the Klemm method. This method indicates the extent of dampness of a 15 cm wide paper strip (dipped in 20 °C dist. water) after 10 minutes. You will, however, frequently find the migration distance of chromatographic paper specified in mm/30 min.

Application instructions:
Chromatography paper and cardboard must always be handled carefully.
Your fingers should not touch the paper as the separation process will be disrupted by skin excretion, such as salt, grease and amino acids. Please avoid folding or creasing the paper as this will impair the capillary action.

Ion chromatography (IC)

ROTI®Star Standards for IC

Roth has an extensive range of products which meets the highest standards of quality in the field of ion standards.

The solutions and mixtures are made using materials of the highest purity, and therefore meet the requirements for instrumental analysis by IC. All solutions are certified and can be traced to NIST or BAM standard reference solutions. Solutions are produced according to **ISO 17034** in an accredited environment. The solutions are tested in a laboratory accredited to **ISO/IEC 17025** and supplied with a detailed, batch-specific certificate of analysis.

Ion Standards for IC

Each standard solution is made of high-purity starting materials, and its content is determined gravimetrically and by ion chromatography. Comprehensive certificates of analysis with ion chromatogram included.

- Single and multi-element standards
- Anion and cation multi-element standards
- Container sizes: 100 ml and 500 ml

NUCLEODUR®
Columns for HPLC

NUCLEODUR® as a state-of-the-art silica is the ideal base material for modern HPLC phases.
We offer two phases **NUCLEODUR® C18 Gravity** which is ideal for sophisticated analytical separations and **NUCLEODUR® C18 ec** suitable for routine HPLC analysis.

NUCLEODUR® C_{18} Gravity

The ideal phase for overall sophisticated analytical separations

- Especially suitable for LC-MS applications due to low bleeding properties
- Ideal for method development
- Superior base deactivation

Properties:
Octadecyl phase, multi-endcapped
Carbon content: 18 %
Pore size: 110 Å
pH stability: 1-11
Eluent on column: acetonitrile / water

Applications:
Pharmaceuticals, e.g. analgesics, antiinflammatory drugs, antidepressants, immunosuppressants, phytopharmaceuticals; herbicides

Similar phases:
Zorbax® Extend C_{18}, Synergi™ 4 µm Max RP, Phenomenex Luna® C_{18} (2), Waters Xterra® RP_{18} / MS C_{18}, Inertsil® ODS III, Purospher® RP-18, Star RP-18, USP L1

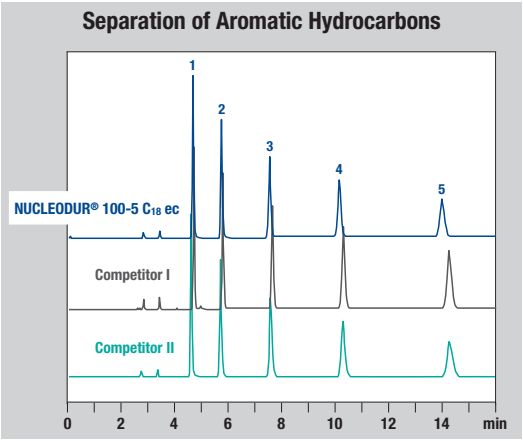
NUCLEODUR® C_{18} ec



The ideal standard RP phase for routine HPLC analysis

- Cost-effective and reliable
- Long-life columns
- For all standard routine applications in modern RP-chromatography

Properties:
Octadecyl phase, endcapped
Carbon content: 17,5 %
Pore size: 110 Å
pH stability: 1-9
Eluent on column: acetonitrile / water

Applications:
Basic, neutral or acidic pharmaceuticals, derivatised amino acids, pesticides, aldehydes and ketones, fat-soluble vitamins, phenolic compounds

Similar phases:
For many applicatons the following phases can be replaced with identical or even better results: NUCLEOSIL® C_{18}, Spherisorb® ODS I and II, Hypersil® ODS, Waters Symmetry® C_{18}, Inertsil® ODS II, Kromasil® C_{18}, LiChrospher® RP_{18}, RP C_{18} ec, USP L1

Conditions:
Eluent: acetonitril / water (75/25, v/v)
Flow: 1,3 ml/min
Temperature: 30 °C
Detection: UV 254 nm
Legend:
1. Toluene, 2. Ethylbenzene, 3. Propylbenzene, 4. Butylbenzene, 5. Pentylbenzene

Guard Columns Systems

Column Protection System

Innovative and universal screw-on guard column holder system. Suitable for all analytical HPLC columns with 1/16" fittings

Features

- Ideal protection for your analytical main column → significant increase in column lifetime
- Minimised void volume → suitable also for ultra fast HPLC
- Special ferrules → pressure stability up to 1 300 bar (18 850 psi)
- Visual contamination check → in-time changing of the guard column
- Guard column length 4 mm, ID 2 mm (for main columns with ID 2 mm) or ID 3 mm (for main columns with ID 3, 4 and 4,6 mm)
- UNIVERSAL RP guard columns suitable for all HPLC columns under RP conditions

Content of the column protection system

- Cartridge holder (1 piece)
- Capillaries (2 pieces)
- Ferrules (3 pieces)
- Wrenches (2 pieces)
- Manual

Ion Pair Reagents

Ion pair reagents consist of ionic molecules with strong hydrophobic character which form neutral ion pairs with oppositely charched sample molecules.
This way, the simultaneous separation of charged and non-charged molecules is possible.

Advantages:

- High purity
- High UV permeability
- Broad range of products
- Excellent price/performance ratio

ROTISOLV®
Ultra LC-MS Solvents

Short analysis times in ultra-fast HPLC as well as systems coupled to a mass spectrometer require solvents which offer utmost reliability, sensitivity and reproducibility.
Our **ROTISOLV® Ultra LC-MS solvents** are specially suited for meeting these demands and have undergone extremely intensive production and quality controls.

- Filtered through **0,1 µm** membrane
- Extra high purity (≥99,98 %)
- Bottled under protective gas
- High UV-permeability
- Low fluorescence
- LC-MS suitability tested
- Solid residue from evaporation max. 1 ppm
- Metal trace impurities max. 100 ppb

ROTISOLV®
LC-MS Grade Solvents

Modern analysis methods such as LC-MS (combination of liquid chromatography and mass spectrometry) call for a special solvent quality which has the required purity and which has been tested under application-oriented conditions.
Very high purity and very low metal concentrations are features of these products which allow exact interpretations of the mass spectra.

- High chemical purity (≥99,95 %)
- High UV-permeability
- Low fluorescence
- Superior gradient baseline
- Metal trace impurities (≤0,05 ppm)
- Test for LC-MS suitability
- Filtered through 0,2 µm membrane
- Bottled under inert gas

Assortment ROTISOLV® HPLC Solvents

for liquid chromatography

Available in different quality grades:
- **HPLC Grade**
- **HPLC Gradient Grade**
- **HPLC Ultra Gradient Grade**

ROTISOLV® HPLC solvents meet all the requirements in high-performance liquid chromatography (HPLC). Their application ranges from routine applications (HPLC Grade) to specific analytic tasks (HPLC Ultra Gradient Grade).

- High chemical purity
- High UV-permeability
- Low fluorescence
- Low residue from evaporation
- Low water and acid content
- Filtered through 0,2 µm membrane
- Bottled under inert gas

ROTISOLV®
LC-MS-Eluent Mixtures

ready-to-use

Features:

- Ready-to-use solvent blends for easy handling
- High chemical purity of the used raw material: HPLC solvents (≥99,9 %) and acids (≥99,9 %)
- High accuracy of the ratio of ingredients
- High UV-permeability
- Trace elements: ≤0,05 ppm per element
- LC-MS suitability tested
- Filtered through 0,2 µm membrane
- Bottled under inert gas

Sorbents for Column Chromatography

We offer a wide range of sorbents for conventional column chromatography. A variety of different particle sizes and modifications means that the right filling material is available for all your separation applications.

Silica Gels

Silica gels are the most important sorbents in the purification and separation processes used in column chromatography. Our extensive range of silica gels with various different pore and particle sizes means that we always have the right material for any separation procedure. In addition to standard **60 Å** silica gel, our range includes silica gels with pore sizes between **150 Å** and **1000 Å,** as well **22 Å** and **35 Å** for separating particularly small molecules. A selection of modified silica gel 60 grades completes the range.

Advantages:
- Extensive range
- Stringent quality control of the starting materials and the end products
- High purity; optimised to meet the needs of chromatography applications
- Large surface area for a high loading capacity
- Tight particle size distribution for optimal efficiency and low pressure variations

Applications

Pore size	35-150 Å			250-4500 Å
Fields	Pharmacy	Foods and Cosmetics	Chemistry	Biotechnology
Applications	Vitamins Antibiotics Vaccines Organic Synthesis Lubricants Functional Food	Oils and Fats Natural Products Stripping Agents Chemical Synthesis	Pesticides Lipids	Vaccines DNA Enzymes Carriers Biomolecules

3 Steps to the appropriate silica gel

Step 1: The pore size is selected based on the molar mass of the sample.

Molar mass (g/mol)	Pore size (Å)
<350	35
<800	60
<15 000	150
<100 000	250
<250 000	500
>250 000	1000-4500

Step 2: The grain size is selected with respect to the pressure within the system.

Pressure (bar)	Grain size (mm)
65	0,01
20	0,016-0,024
15	0,02-0,045
5	0,04-0,063
2	0,07-0,2
<1	>0,2

Step 3: The surface functionality is adapted to the solubility of the sample and the required degree of separation.
Polarity series: Silica gel > Diol > Amino > Cyano > C18.

Mobile phase	Stationary phase
Non-polar to medium polar solvents (normal phase)	Silica gel
Non-polar to polar solvents (normal phase, reversed phase)	Diol
	Amino
	Cyano
Polar solvents (reversed phase)	C18

Aluminium Oxide

Our range of aluminium oxides (neutral - alkaline - acidic) for conventional column chromatography most certainly includes the right one for you.

All aluminium oxides are available in activity grade I. Activity grades II to V can be set up by adding water:

- Activity grade I - 0 % water
- Activity grade II - 3 % water
- Activity grade III - 6 % water
- Activity grade IV - 10 % water
- Activity grade V - 15 % water

Flash Chromatography

Flash chromatography is, on account of its superior properties, replacing column chromatography in many laboratories for chemical synthesis, pharmacokinetics and combinatorial chemistry. Flash chromatography can be used to clean samples inexpensively and quickly on a preparative scale up to approximately 100 g. A key factor here is the automation of flash chromatography and the reduced solvent consumption compared to column chromatography.
Thin-layer chromatography is often used for the development of a selective and reproducible method. This way, it is possible to determine the optimal combination of various eluents and sorbents within a short space of time. Our TLC plates and sheets are coated with the same base silica, which is used in our CHROMABOND® Flash cartridges. An advantage of the Roth products is, that our TLC plates and foils are coated with the same basic silica gel, that is also used in the CHROMABOND® Flash columns.Therefore, developed methods can be optimally transferred to flash chromatography.

CHROMABOND® Flash RS Cartridges

Heavy-duty polypropylene cartridges designed for ISCO® Companion® and other Teledyne Isco CombiFlash® systems.

Increased analytical safety: Organic solvent resistant, low bleed cartridges, thick column walls, one piece body, sophisticated length-to-diameter ratio for high plate numbers and excellent separation efficiencies. Distribution of eluent stream via highly porous frits.
High pressure stability: Up to 21 bar for cartridges <40 g, up to 15 bar for 80 g and 120 g cartridges, up to 12 bar for cartridges >200 g
High quality standard: All flash cartridges and adsorbents undergo particulary intensive production and quality control ensure that the products comply to the specification.
Adsorbent weights: 15 g to 330 g.

SPE (Solid Phase Extraction)

A fast, effective and inexpensive system for sample preparation. SPE columns enable samples to be analysed for HPLC, GC, TLC, UV/IR spectroscopy, etc.

Fields of application:
- Food analysis
- Environmental analysis
- Organic chemistry
- Pharmaceutical analysis
- Biochemical analysis

Our range of phases for SPE:

CHROMABOND® HR-Xpert

The professional concept of innovative SPE phases

The CHROMABOND® HR-Xpert concept comprises 5 polymer-based RP and mixed-mode ion exchange phases. Depending on the character of the analytes it offers suitable adsorbents and optimal methods for sample preparation, cleaning and concentration.

State-of-the-art spherical polymer:
- Particle size: 85 µm
- Broad spectrum of application with special suitability for enrichment of pharmaceuticals from biological matrices
- Ideal flow properties due to low content of particulate matter

Optimised pore structure and high specific surface:
- High loadability and outstanding elution properties in RP as well as mixed-mode
- Low solvent consumption
- Rapid, cost-effective analysis

High purity adsorber material
- Allows high reproducibility with extremely low blank values
- Reliable analysis at ultra trace level
- No method adaptation for new batches necessary

HR-Xpert phase	Properties	Application areas
CHROMABOND® HR-X	hydrophobic PS/DVB copolymer	neutral and polar active ingredients and analytes such as pesticides, drugs, phenols, PAHs, PCBs
CHROMABOND® HR-XC	strong acidic mixed-mode benzenesulfonic acid cation exchanger	basic active ingredients and analytes such as amines (melamine), . . . bases with pKa 2-10
CHROMABOND® HR-XA	strong basic mixed-mode quaternary ammonium anion exchanger	acidic active ingredients and analytes such as herbicides, . . . acids with pKa 2-8
CHROMABOND® HR-XCW	weak acidic mixed-mode carboxylic acid cation exchanger	strongly basic active ingredients and analytes such as quaternary amines, . . . bases with pKa > 10
CHROMABOND® HR-XAW	weak basic mixed-mode secondary/tertiary ammonium anion exchanger	strongly acidic active ingredients and analytes such as sulfonic acids, perfluorinated surfactants, . . . acids with pKa < 1

Further CHROMABOND® RP Phases

SPE-polypropylene columns CHROMABOND® HR-X

Spherical, hydrophobic polystyrene/divinylbenzene copolymer

Pore size: 55-60 Å, particle size: 85 µm
Spec. surface: **1000 m²/g**, pH stability: 1-14
RP-capacity: 390 mg/g (caffeine in water)
Please note: high-purity material with homogenous surface and optimised pore structure - due to optimised production process - enables lowest blanks, outstanding recovery rates and highest reproducibility. Especially for the enrichment of pharmaceuticals and active ingredients.

Recommended applications: pharmaceuticals/active ingredients from tablets, creams and water/waste water, drugs and pharmaceuticals from urine, blood, serum and plasma, trace analysis of pesticides, herbicides, phenols, PAHs and PCBs from water

Similar phases: Supelclean™ ENVI-Chrom P, Strata™-X, Oasis® HLB, Bond Elut Nexus

SPE-polypropylene columns CHROMABOND® HR-XA

Quat. ammonium modified spherical polystyrene/divinylbenzene copolymer, strong anion exchanger (mixed-mode)

Pore size: 55-65 Å, particle size: 85 µm
Spec. surface: **850 m²/g**, pH-stability: 1-14
Pore volume: 1,4 cm^3/g
Exchange capacity: approx. 0,25 meq/g
RP-capacity: 350 mg/g (caffeine in water)

Please note: high-purity material with homogenous surface and optimised pore structure - due to optimised production process - enables lowest blanks, outstanding recovery rates and highest reproducibility. Especially for the enrichment of acidic analytes.

Recommended applications: acidic active ingredients from strongly matrix contaminated samples like e.g. urine, plasma, serum, phenolic acids, acidic herbicides

Similar phases: Oasis® MAX, HyperSep™ Retain AX, Styre Screen® QAX, Strata™-X-A

SPE-polypropylene columns CHROMABOND® HR-XAW

Sec./tert. ammonium modified spherical polystyrene/divinylbenzene copoloymer, weak basic anion exchanger (mixed-mode)

Pore size: 55-65 Å, particle size: 85 µm
Spec. surface: **850 m²/g**, pH stability: 1-14
Pore volume: 1,2-1,4 cm^3/g
Exchange capacity: >0,5 meq/g
RP capacity: 350 mg/g (caffeine in water)
Please note: high-purity material with homogenous surface and optimised pore structure - due to optimised production process - enables lowest blanks, outstanding recovery rates and highest reproducibility. Especially for the enrichment of strongly acidic analytes.

Recommended applications: perfluorinated surfactants, acidic active ingredients from strongly matrix contaminated samples like e.g. urine, plasma, serum, strong acids with pKa <1

SPE-polypropylene columns CHROMABOND® HR-XC

Benzenesulphonic acid modified spherical polystyrene/ divinylbenzene copolymer, strong cation exchanger (mixed-mode)

Pore size: 65-75 Å, particle size: 85 µm
Spec. surface: **800 m²/g**, pH-stability: 1-14
Pore volume: 1,4 cm^3/g
Exchange capacity: 1,0 meq/g
RP-capacity: 300 mg/g (caffeine in water)
Please note: high-purity material with homogenous surface and optimised pore structure - due to optimised production process - enables lowest blanks, outstanding recovery rates and highest reproducibility. Especially for the enrichment of basic analytes.

Recommended applications: Basic active ingredients from strongly matrix contaminated samples like urine, plasma, serum, fungicides from food, basic analytes like e.g. amines, bases with pKa 2-10

Similar phases: Oasis® MCX, Strata™-X-C, Styre Screen® DBX, Hyper Sept™ Retain

SPE-polypropylene columns CHROMABOND® HR-XCW

Carboxylic acid modified spherical polystyrene/divinylbenzene copolymer, weak acidic cation exchanger (mixed-mode)

Pore size: 50-60 Å, particle size: 85 µm
Spec. surface: **850 m²/g**, pH stability: 1-14
Pore volume: 1,2-1,4 cm^3/g
Exchange capacity: >0,7 meq/g
RP capacity: 350 mg/g (caffeine in water)
Please note: high-purity material with homogenous surface and optimised pore structure - due to optimised production process - enables lowest blanks, outstanding recovery rates and highest reproducibility. Especially for the enrichment of basic analytes.

Recommended applications: Active ingredients from strongly matrix contaminated samples like e.g. urine, plasma, serum, strong bases with pKa >10.

Basic compounds like quaternary amines.

Further CHROMABOND® RP Phases

SPE-polypropylene columns CHROMABOND® Easy

Polar modified polystyrene/divinylbenzene copolymer with a weak ion exchanger
Pore size: 50 Å, particle size: 80 µm
Spec. surface: **650-700 m²/g,** pH-stability: 1-14

Please note: Due to its bifunctional modification it is much more hydrophilic than conventional polystyrene/divinylbenzene polymers and thus easily wettable with water.

Recommended applications: Drug analysis from urine, blood, serum, plasma, pharmaceuticals/active ingredients from tablets, creams, polar herbicides/pesticides from water (acidic, neutral, basic), polar phenols from water, PAHs, PCBs

Similar phases: Strata™-X, Oasis® HLB, Sep-Pak® Porapak RDX, Nexus, Bond Elut® PPL, Styre Screen® DVB, Bakerbond™ H_2O philic DVB, Isolute® ENV+

Octadecyl-modified silica gel, endcapped
Pore size: 60 Å, particle size: 45 µm
Spec. surface: **500 m²/g**, pH stability: 2-8

Please note: Extremely non-polar, hydrophobic interaction with many organic compounds.

Recommended applications: non-polar compounds
preservatives, fatty acids, PAHs, pesticides, PCBs, heavy metals, vitamins, aflatoxins, amphetamines, antibiotics, antiepileptics, barbituates, caffeine, nicotine, drugs, etc. Ideal for the determination of phthalates. Also suitable for desalting samples

Ion exchanger phases

SPE-polypropylene columns CHROMABOND® SB (SAX)

Quat. ammonium modified silica gel, strongly basic anion exchanger

Pore size: 60 Å, particle size: 45 µm
Spec. surface: **500 m²/g**, pH stability: 2-8
Exchange capacity: approx. 0,3 meq/g

Please note: Not suitable for very strong anions such as sulphonic acids, because these are difficult to elute.

Recommended applications: Organic acids, caffeine, saccharin

SPE-polypropylene columns CHROMABOND® SA (SCX)

Benzenesulphonic acid modified silica gel, strongly acidic cation exchanger

Pore size: 60 Å, particle size: 45 µm
Spec. surface: **500 m²/g**, pH stability: 2-8
Exchange capacity: approx. 0,5 meq/g

Please note: Adsorbent with hydrophobic and π-π-interactions (benzene ring); Ion exchange of organic compounds from aqueous matrix; Elution of interesting compounds with solvent systems, which compensate the ionic and non-polar interactions, e.g. methanolic HCl.

Recommended applications: Amino acids, chlorophyll, amines, PCBs

Similar phases: Strata® SCX, Bond Elut SCX, Discovery® DSC-SCX, Supelclean™ LC-SCX, CLEAN-UP® Benzenesulfonic Acid, Bakerbond™ Aromatic Sulfonic Acid, Isolute® SCX, LiChrolut® SCX

Liquid-Liquid Extraction

Polypropylene columns CHROMABOND® XTR

Kieselguhr phase for liquid-liquid extraction

Features:
- Base material coarse-grained kieselguhr (also known as diatomaceous earth, hydromatrix, Celite®)
- Large pore size, high pore volume, constantly high batch-to-batch quality
- pH working range 1-13

Application:
- Liquid-liquid extraction of highly viscous aqueous solutions such as physiological fluids (blood, plasma, and serum), dyes in textiles, environmental and food analysis without use of a separation funnel
- High water loadability without breakthrough of water during elution with organic solvents
- Also suitable for removing small amounts of water from solvents which are not miscible with water

Advantages:
- Fast, reproducible and cost-effective
- Simultaneous preparation of several samples
- No problems with phase separation, no formation of emulsions
- High recovery rates
- Time and solvent saving
- Organic solutions do not need to be dried after separation

General column parameters:

Volume	Amount of adsorbant	Max. volume capacity of aq. solution	Waiting period before elution	Elution volume
6 ml	1 g	1 ml	5-10 min	8 ml
30 ml	4,5 g	5 ml	5-10 min	16 ml
70 ml	14,5 g	20 ml	10-15 min	40 ml

Depending on the concentration of the analytes eluates can be analysed immediately, or the organic solvent is evaporated. The pH value of the aqueous solution can be altered on the column, which enables elution of different compounds of a sample under optimised conditions. Under certain circumstances, acidic, neutral, and basic compounds can be fractionated in this way.

Solvents applicable for elution:
Diethyl ether (T900)
tert-Butyl methyl ether (T175)
Ethyl acetate (T164)
n-Hexane (T165)
Cyclohexane (T163)
Toluene (T166)
Dichloromethane (T162)
Trichloromethane / chloroform (T901)
Trichloromethane / methanol (90/10, v/v) (T901/T909)
Trichloromethane / methanol (85/15, v/v)
Diethyl ether / ethanol (90/10, v/v)(T900/9065)
Diethyl ether / ethanol (80/20, v/v)
Dichloromethane / 2-propanol (90/10, v/v) (T162/T902)
Dichloromethane / 2-propanol (85/15, v/v)

Eluents with higher alcohol contents cause an increase in volume of the aqueous phase on the CHROMABOND® XTR. In such case, the column might be overloaded which leads to a displacement of the aqueous phase from the column. Therefore, a greater capacity column should be used.

Extraction of analytes form an aqueous to an organic phase: TIP

Column conditioning: Not required

Sample application: Aqueous solutions are applied to the dry CHROMABOND® XTR adsorbent. They are soaked up by the solid within a few minutes and spread over the surface of the kieselguhr material as a thin film.

Elution: Lipophilic analytes are eluted with water-immiscible organic solvents; the aqueous phase remains on the CHROMABOND® XTR adsorbent.
Polar, water-soluble analytes, which remain in the aqueous phase on the XTR adsorbent, can be eluted e.g. with saturated NaCl.

Warning: Never exceed the volume capacities listed for each column size!

QuEChERS Products

For pesticide residue analysis in food

Within a few years after its development the QuEChERS method has gained a leading position for determination of pesticide residues in food samples by GC-MS or LC-MS, allowing rapid and cheap clean-up of highly matrix-contaminated samples.
For optimising the extraction of pH-dependent compounds, for minimizing decomposition of sensitive substances, and for broadening the matrix spectrum, different modifications of the QuEChERS method have been elaborated.
In addition to the required adsorbent Silica gel 60 diamino a number of individually weighed and premixed buffer and extraction mixtures are offered, specially composed for different sample matrices.
For extraction, the European standard EN 15662 recommends a citrate extraction mix (Mix I), while AOAC standard 2007.1 uses an acetate extraction mix (Mix II).
For clean-up, the Diamino phase (PSA) removes, e.g. sugars and organic acids. Magnesium sulphate removes water, C_{18} ec removes non-polar interferences such as fats and the carbon phase removes pigments, sterols, and nonpolar interferences.
For selection of the proper clean-up mix see table below.

Standard clean-up in food samples:
10 g sample are homogenised with 10 ml acetonitrile. After adding the internal standard the sample is shaken with 4 g magnesium sulphate and 1 g sodium chloride and afterwards centrifuged. 1 ml of the supernatant is spiked with 25 mg CHROMABOND® Diamino and 150 mg magnesium sulphate and shaken again. After centrifugation the supernatant is injected to GC-MS.

Salts for Analysis

Our salts for analysis are manufactured under strict production guidelines. Analytical purity and best quality reliably characterize each batch.
Salts in p.a. quality made by Roth meet the high requirements for reproducible results. Most of our salts are additionally specified according to international standards like ACS and ISO.

Volumetric standard solutions

A standard solution is a solution containing a precisely known concentration of a substance. The concentration of a standard solution is determined using a primary standard, which is accurately weighed and dissolved to make a specific volume. Standard solutions are made using reagent-grade (p.a.) substances as source materials.

Volumetric standard solutions, ready-to-use

ready-to-use

The advantages of this over making them yourself are:

- Manufactured and tested using modern manufacturing and analytical methods
- Available in a wide range of concentrations
- Ready-to-use solutions
- High accuracy for precise analyses
- Application of NIST-certified reference substances for checking
- Connection to standard titrators is possible

ROTI®VOLUM, volumetric solutions in ampoules

- Concentrated standard solutions packaged in practical and low-cost ampoules
- Designed for flexible and easy handling, and as a space-saving alternative to ready-to-use custom solutions
- Standard solutions are prepared through dilution to a final volume of exactly one litre.
- Exactly defined molar concentration (±0,2 %) according to the preparation
- High accuracy for precise analyses

Titer details:
Many of our standard solutions also provide the corresponding titer details on the certificate of analysis, in addition to the amount of substance concentrations. If this is not the case, you can assume that the titer is as follows:
1 ± variation from specification.
Example: Amount of substance concentration 0.1 mol/l ±0.2 %
It follows that the titer is 1 ±0.2 %, i.e. 0.998-1.002
We recommend the regular checking of the titer prior to application for opened products.

Indicators and Dyes

Roth offers many indicators and dyes of high purity, which can be used in special applications.

Unisol Indicator solutions

By Macherey-Nagel. For pH measurement in weak buffered solutions, in pure water, in surface water and in highly diluted acids or alkalis. Droplets of an indicator solution are added to the sample and the reaction colour is compared to a colour chart.

Delivery incl. 100 ml dropper bottle containing reagent (sufficient for approx. 500 pH measurements), colour chart and 1 type 13/72 measuring cuvette.

Karl Fischer Reagents Roti®hydroquant

There are two established Karl Fischer methods of calculating the water content of a substance: Volumetric analysis and coulometric analysis.

Which method is chosen depends primarily on the water content that the sample is expected to have. Making the right choice is vital for obtaining reliable and reproducible results. Roth offers compatible reagents for both of these methods.

Volumetric reagents

Karl Fischer volumetric analysis is recommended if the water content of a sample ought to be between 0,1 % and 100 %. Volumetric analysis is performed by measuring the amount of Karl Fischer reagent that needs to be added to a substance until the end point of the titration has been reached. In alcoholic solutions, water reacts 1:1 with iodine in the presence of sulphur dioxide. Methanol and sulphur dioxide form an acid ester that is neutralised by the base (e.g. imidazole, hereafter referred to as "RN" for simplicity).

$CH_3OH + SO_2 + RN \rightarrow [RNH]SO_3CH_3$

In the titration process, iodine is added which reacts with water to be reduced to colourless iodide:

$[RNH]SO_3CH_3 + H_2O + I_2 + 2\ RN \rightarrow [RNH]SO_4CH_3 + 2\ [RNH]I$

This reaction continues until there is no water left. The end point is determined by a change in colour due to a surplus of iodine and measured using a potentiometer.

Single-component reagents

Single-component reagents contain all the substances required for the Karl Fischer reaction in a single solution. They are easy to use and provide for a high level of flexibility when choosing a solvent for the sample type. The high reactivity of the components means that the titre for single-component reagents must always be determined before titration is carried out.
Reactions with standard reagents containing methanol are not possible for samples that contain aldehydes or ketones, as the methanol will react with them to produce extra water in a secondary reaction. Roth offers methanol-free reagents that are suitable for substances containing aldehydes and ketones.

			T193.2	2,5 l	glass	54,75

Two-components reagents

In two-component systems, the substances crucial for the reaction are separated, with some in the solvent component and some in the titration component. Separating the substances gives the system a longer shelf life and means that the titre needs to be determined less frequently.

The volumetric Karl Fischer reagents are suitable for water contents between 0,1 % and 100 %. Free water and water of hydration can be determined, respectively.
Our solutions are based on methanol and free of pyridine.

Using single-component reagents:
Add Methanol to the reaction vessel and titrate to dryness with the C-component. Then add the sample and titrate again to dryness.

Using two-component reagents:
Add solvent S to the reaction vessel and titrate to dryness with the T-component. Then add the sample and titrate again to dryness.

Coulometric reagents

Karl Fischer coulometric titration is suitable for substances with a low water content (i.e. <0,1 %) and, for example, for expensive substances that can only be examined in small quantities. In the coulometric titration process, the iodine required is produced directly in situ at the electrode in the reaction vessel through the anodic oxidation of iodide. Hydrogen is produced at the cathode. The measuring cell contains an anode and cathode chamber, which can be separated by a diaphragm. This means that the titration cell can be equipped with diaphragms or be diaphragm-free.

Roth offers suitable reagents for both models.

Determination of water hardness

Water contains a whole host of salts and other compounds in addition to the gases dissolved in it (oxygen, nitrogen, carbon dioxide). Its most important constituents are magnesium and calcium in the form of their chlorides, sulphates and bicarbonates. These dissolved salts are known as hardeners. The bicarbonates precipitate in the heat (during boiling) as carbonates and are known as carbonate hardness or temporary hardness. The sulphate and chloride compounds are known as permanent hardness or non-carbonate hardness.Total hardness describes the concentration of alkaline earth metal ions in water.The unit of measurement for water hardness used to be 1 °dH (German degrees of hardness), which corresponds to 10,00 mg CaO or 7,19 mg MgO in one litre of water. Today we use millimoles per litre (mmol/l), whereby 1 °dH corresponds to 0,18 mmol/l of earth metal ions and 1 mmol/l corresponds to 5,6 °dH.

Determination of adsorbable organic halogen compounds (AOX)

AOX (adsorbable organic halogens, where X = Cl, Br, I) is a sum parameter that describes the amount of organic halogen compounds in substances such as water, soil and sewage sludge. This parameter is used primarily in waste water analysis. The method for calculating AOX levels is set out in DIN EN ISO 9562. The quantity of organically bound halogens in a water sample is measured using either the shaking method or the column method. In the shaking method, the AOX in a sample are bound to activated carbon by shaking. In the column method, the AOX in a sample are bound to activated carbon by the action of flushing the sample through a glass column filled with activated carbon. The quantity of activated carbon, which is defined precisely in each case, is then burned in an oxygen chamber and the hydrogen halide released is measured by means of argentometry. The amount of fluoroorganic compounds present cannot be measured argentometrically.

Determination of chemical oxygen demand (COD)

COD (chemical oxygen demand) is a measure of all the oxidisable components in water under specific conditions. The water sample is mixed with sulphuric acid and heated together with a defined quantity of potassium dichromate, with silver sulphate added as the catalyst. Chloride must be removed beforehand or masked with mercury sulphate. The remaining potassium dichromate is measured by means of titration, using an ammonium iron(II)sulphate solution and ferroin as the indicator. The equivalent amount of oxygen can then be calculated from the amount of potassium dichromate that is used up.

Determination of biological oxygen demand (BOD)

BOD (biochemical oxygen demand) is a measure of the amount of oxygen that microorganisms need to break down the organic material in a water sample over a specific period of time. It is important to calculate the oxygen concentration at the start and end of the measuring time, which is usually five days and is expressed as an index (BOD_5). Chemical, electrochemical or physical methods are used for this calculation.

Determination of the hydrocarbon index

The hydrocarbon index is defined as the total of all organic substances that can be extracted with hexane, but cannot be adsorbed in Florisil® (magnesium silicate). On a covalent GC column, these elute between n-decane and n-tetracontane and have a boiling range of 175-525 °C. These include heating oils, diesel fuels, kerosene, lubricants and transmission fluids. Petrols are not detected using this method. Roth offers an extensive range of products for the determination of the hydrocarbon index in accordance with EN ISO 9377-2-Mod. (DIN H53).

Determination of nitrogen according to Kjeldahl

The most common technique for measuring the amount of nitrogen in organic matter is the Kjeldahl method, which is used in a wide range of sectors such as environmental analysis, food analysis, water analysis and agricultural analysis, as well as in the pharmaceutical and chemical industries. In this traditional method, a precisely weighed sample is broken down using concentrated sulphuric acid, a process which digests its organic contents and reacts nitrogen to form ammonium sulphate.

$$(CHNO)_{(s)} \xrightarrow{H_2SO_4} CO_{2\,(g)} + SO_{2\,(g)} + H_2O_{(g)} + NH_4SO_{4\,(solv,\ H_2SO_4)}$$

A catalyst or catalyst mixture consisting of copper, selenium, mercury and/or titanium is added to speed up the reaction. Sodium or potassium sulphate is used to give the sulphuric acid a higher boiling point. If the nitrogen is contained in a nitro, nitroso or azo compound, however, the mixture must be reduced with zinc before digestion takes place.
The nitrogen is now present in the sulphuric acid as ammonium sulphate. Adding a strong base (such as NaOH) neutralises the sulphuric acid and liberates ammonia from the solution.

$$NH_4SO_{4\,(solv)} + 2\ NaOH_{(aq)} \longrightarrow Na_2SO_{4\,(aq)} + 2\ NH_{3\,(g)} + 2\ H_2O_{(l)}$$

The ammonia is led into an acid (such as boric acid) by means of steam distillation.

$$B(OH)_{3\,(aq)} + H_2O_{(l)} + NH_{3\,(g)} \longrightarrow B(OH)_4^-{}_{(aq)} + NH_4^+{}_{(aq)}$$

The resulting strong base (borate ion) is back-titrated with a strong acid (hydrochloric acid or sulphuric acid). The excess weak boric acid is not captured in the process. A Tashiro's indicator that changes colour in the acid is used for titration. The amount of acid that has been used up can then be converted into the amount of nitrogen in the sample.

$$NH_4^+{}_{(aq)} + B(OH)_4^-{}_{(aq)} + HCl_{(l)} \longrightarrow NH_4Cl_{(aq)} + B(OH)_{3\,(aq)} + H_2O_{(l)}$$

To calculate the protein content of the sample, the varying nitrogen content of the amino acids must be checked and the relevant conversion factors applied. The nitrogen contained in food derives mainly from proteins, but different samples may also contain other sources of nitrogen.

Determination of Sugar

Fehling's test:

Fehling's test is used to identify reducing agents, such as aldehydes and reducing sugars. Combining the two separate solutions (Fehling's I and Fehling's II) produces a deep-blue tartrate-copper(II) complex. Adding a reducing sample then causes a red pigment consisting mainly of copper(I) oxide to precipitate out of the mixture. This change in colour does not happen in the presence of sucrose or ketones.

Luff-Schoorl method:

This method can be used to calculate the amount of reducing sugars, such as D-glucose, D-fructose, D-lactose and D-maltose, that a sample contains. In this method, the copper(II) ions in an alkaline solution are reduced by the sugar and determined by means of back-titration of the excess reagent added. Non-reducing sugars, such as D-sucrose, are not captured by this method. To determine the amount of this sugar present, it must first be broken down into reducing monosaccharides via acid hydrolysis.

Determination of mercury

Mercury has been used in technical applications since ancient times. Its high mobility means that it is particularly prevalent in the environment. Yet huge amounts of it are continuously being released into the atmosphere, for example through combustion reactions. Mercury forms organic compounds that are fat-soluble, which enables them to enter the food chain. The two most commonly used standard methods for analysing mercury are the AAS (atomic absorption spectroscopy) procedure and the ICP (inductively coupled plasma) technique. It goes without saying that the reagents used to prepare samples must not contain mercury. Roth offers these reagents with a mercury content of less than 0,05 ppm.

Determination of trichina

Trichina (*Trichinella*, ssp.) are small roundworms approximately 1 mm long that live as parasites in the skeletal muscles of mammals, birds and reptiles. They can be transferred to a new host (human or animal) through the consumption of raw meat containing infectious larvae in the muscle tissue. Meat intended for human consumption must be inspected in accordance with Regulation (EU) No. 2075/2005. Roth offers reagents suitable for this purpose.

Pepsin

≥2000 FIP-U/g, for biochemistry

From porcine gastric mucosa. For detection of trichina in meat.
M 35000 g/mol
Storage temp.: +4 °C

Danger H334-H335-H315-H319

Acidic endopeptidase, the inactive precursor of which, pepsinogen, is produced in the stomach mucosa. Pepsin cleaves proteins preferentially at carboxylic groups of aromatic amino acids such as phenylalanine and tyrosine. Highly active pepsine is preferably used for detection of trichina in pre-digested muscle meat of animals.
1 FIP unit (≈Ph. Eur. unit) of Pepsin activity will, during incubation at 25±0.1 °C for one minute, cause decomposition of haemoglobin to an extent comparable with the colour caused by reaction of 1 micromole of tyrosine with the same dye. 2 000 FIP-Units correspond to 1: 10 000 NF-U and 1: 12 500 BP-U.

Application:
Well soluble in water, stable in aqueous solutions of pH up to 5.5, unstable above pH 6.0. Irreversible inactivated in alkaline medium. Solution is stable in temperatures of up to 60 °C, and also in higher concentrations of urea and guanidine.

Determination of fat

Fat analysis is used to determine the fat content and fat composition of foodstuffs. Individual components or total fats levels can be calculated depending on the purpose of testing. Different components are subject to different procedures by law, such as the Gerber method or the Van Gulik technique.

Fat- and protein-containing samples should be cleared using Carrez reagents:

- Add sample to 60 ml water
- Subsequently add, while mixing after each step:
  a) 5 ml Carrez-I-solution, Art. No. 9944
  (or 7,2 g zinc sulphate heptahydrate, Art. No. K301 add 100 ml)
  b) 5 ml Carrez-II-solution, Art. No. 9950

- Adjust pH to 7,5 - 8,5 by adding NaOH (0,1 M), Art. No. K020
- Fill volumetric flask up to mark, mix, and filter

Iodine value determination

The iodine value is a measure of the unsaturated fatty acids in glycerides. The more olefinic double bonds there are in the fat, the higher the iodine value.

Acid value determination

The acid value expresses the acidic components of fats. To calculate this value, a sample is dissolved in a solvent and titrated with a solution of potassium hydroxide with phenolphthalein as the colour indicator. Only the free fatty acids are captured; the fatty acids bound in the glycerides are not.

Peroxide value determination

The peroxide value of a substance denotes how much peroxide it contains. In a mixture of glacial acetic acid and chloroform, the peroxide oxidises the iodide into elementary iodine. The resulting quantity of iodine is then back-titrated using a thiosulphate solution (where a starch solution is used as the indicator). The blank solution tested in parallel is used to calculate the results.

Saponification value

The saponification value denotes the amount of potassium hydroxide required to neutralise free fatty acids and saponify bound fatty acids. The lower the average molar mass of the fat, the higher the saponification value. The sample is heated under reflux in a defined quantity of ethanolic potassium hydroxide solution and the non-used alkaline solution is titrated with hydrochloric acid.

Determination of viscosity

Viscosity is the measure of a fluid's resistance to flow. The lower a liquid's viscosity, the thinner it is and the more easy it is to pour; the higher a liquid's viscosity, the thicker it is and the harder it is to pour. The particles in viscous liquids are less mobile as they have to overcome the van der Waals forces and the bonds between the particles in them are stronger.

Density determination

Sodium polytungstate (SPT) is perfect for preparation of heavy liquids. Roth offers an environmentally friendly alternative to using zinc chloride and mercury saline solutions or highly toxic halogenated hydrocarbons to conduct the sink or swim analyses required for density determination.

Properties:
- Highly water soluble
- pH-neutral solution adjustable
- Maximum achievable density of the solution is 3,1 g/cm³ at 25 °C

Advantages:
- Non-toxic
- Non-flammable
- Odourless
- Low viscosity
- Easy to use
- Extremely easy to clean the sinks and floats with water
- Environmentally friendly

Hydroxyl value

The hydroxyl value is a measure of the hydroxy group content of organic materials such as paints, resins, polystyrenes, solvents and lipids. It represents the amount in milligrams of potassium hydroxide required to neutralise the quantity of acetic acid that combines on acetylation of one gram of the substance being tested.

Fluoride value determination

In quantitative assays, TISABs (total ionic strength adjustment buffers) are used to set the ionic strength of a solution to a stable level using ion-selective electrodes. The ionic strength must be kept stable during the measuring process in order to prevent the potential from changing regardless of the molar concentration. The measurement of fluoride ions is highly susceptible to error; high pH values or aluminium(III) and iron(III) ions will falsify the results.

Products in VLSI quality

Roth's VLSI (Very Large Scale Integration) product line offers solvents and acids for cleaning and etching wafers for the semi-conductor industry. Both processes are essential for chip manufacture. Roth offers a selected range of products.

Solvents

Properties:

- High purity
- Trace metal content generally between 10-50 ppb
- Particle-filtered, maximum 250 particles/ml

VLSI or Very Large Scale Integration means that a large number of transistors (now several 100 million.) are located on one chip. Since the gaps are very small, roughly 3 µm, the solvents and acids must be of a correspondingly high purity and be particle-filtered. For VLSI, the number of particles is limited to 250 p/ml.

ROTI®Calipure standards for your calibration needs

Roth offers an extensive range of calibration standards. These products are manufactured from highly pure starting material and are specially tested for each application. The corresponding batch-specific certificate of analysis is available online. Each product series offers excellent value for money.

Melting point standards ROTI®Calipure

The melting point of a substance is the temperature at which the transition from a solid phase to a liquid phase occurs. The determination of melting point is a quick and easy method of determining the basic purity of substances. As the melting point is a characteristic variable for pure substances, it is also used for the identification of organic compounds. Roth offers a selected range of melting point standards. To allow easy handling and ensure maximum safety, the standards are filled in small quantities protected from light and are ready to use straight away.

Features:
- Suitable for checking purity
- Suitable for use independent of instrument type
- Ready-to-use

Density standards ROTI®Calipure

Our Density standards are made of high-quality reagents and are tested by Bingham Pycnometer. They can be used with any brand or type of density measuring instrument. The batch specific Certificates of Analysis are available online.

Properties

- No toxic metals are used in the products
- Calibration standard for density measurement by pycnometric, vibrational or hydrometer based techniques
- Usable with any brand or type of density measuring instrument
- Consistently high quality from batch to batch
- For testing of Density or Relative Density

Viscosity standards ROTI®Calipure

Our viscosity standards are manufactured from high-quality reagents and tested using Ubbelohde Master Viscometers. All standards are tested for kinematic viscosity (mm^2/s, cSt) as well as dynamic viscosity (cP) and density (g/ml) at different temperatures up to 100 °C. They can be used for calibration, control, verification, qualification or method validation of kinematic and dynamic viscosity. The batch specific Certificates of Analysis are available online.

pH-Buffer Solutions, ROTI®Calipure

- Manufactured from high purity buffer substances
- No need for time-consuming drying and weighing of reagents
- The buffer solutions are adjusted to their respective pH values by comparison with standard buffer solutions (according to DIN 19266 and based on primary reference materials of the PTB and/or NIST)
- Quick and precise calibration of measuring equipment
- Stabilised against algae and bacterial action

ROTI®Star Standards for AAS and ICP

Roth has an extensive range of products which meets the highest standards of quality in the field of element standards and ion standards. The solutions and mixtures are made using materials of the highest purity, and therefore meet the requirements for instrumental analysis by AAS and ICP. All solutions are certified and can be traced to NIST standard reference materials. Solutions are produced according to **ISO 17034** in an accredited environment. The solutions are tested in a laboratory accredited to **ISO/IEC 17025** and supplied with a detailed, batch-specific certificate of analysis.

Single Element Standards for AAS ready-to-use

(Atomic Absorption Spectroscopy)

AAS standard solutions are made from high-quality reagents, and therefore ensure maximum precision during calibration. Accuracy and precision for reliable measurement results.

- 42 single element standards
- Concentration 1000 mg/l (1 g/l)
- Container sizes: 100 ml and 500 ml
- 24 months shelf life for unopened bottle & 12 months after the bottle has been opened

Multi-Element Standards for Graphite Furnace AAS

ready-to-use

This multi-element standard is produced from ultra-pure raw materials and in accordance with strict quality guidelines. The traceability and standard reference material of the NIST is documented on the comprehensive certificate of analysis. The standard is suitable for the calibration of graphite furnace AAS units.

Matrix Modifer Solutions for Graphite Furnace AAS

Matrix modifier solutions by Roth are made from high purity starting materials (≥99,999 %) and delivered with a detailed batch specific certificate of analysis.
The solutions can be used either diluted or as mixtures, and are suitable for eliminating matrix effects in graphite furnace AAS.

- Up to 70 measured trace impurities in ppm range and lower
- Guaranteed accuracy: ±1 %
- Container size: 50 ml

Single Element Standards for ICP-OES

ready-to-use

(Inductively Coupled Plasma – Optical Emission Spectrometry)

The solutions and mixtures are made using materials of the highest purity, and therefore meet the requirements for by AAS and ICP. All solutions are certified and can be traced to NIST standard reference solutions. Solutions are produced according to **ISO 17034** in an accredited environment. The solutions are tested in a laboratory accredited to **ISO/IEC 17025** and supplied with a detailed, batch-specific certificate of analysis.
Each standard solution is made of high purity starting materials (mostly ≥99,999 %), and its content is determined gravimetrically and by ICP. High quality acids (purified by subboiling distillation) and water are used for production of the solutions. This gives you first-class reference materials of the highest purity and quality.

- 68 single element standards

Multi Element Standards for ICP-OES ready-to-use
(Inductively Coupled Plasma – Optical Emission Spectrometry)

The solutions and mixtures are made using materials of the highest purity, and therefore meet the requirements for instrumental analysis by AAS and ICP. All solutions are certified and can be traced to NIST standard reference solutions. Solutions are produced according to **ISO 17034** in an accredited environment. The solutions are tested in a laboratory accredited to **ISO/IEC 17025** and supplied with a detailed, batch-specific certificate of analysis. A series of mixtures of different element combinations and concentrations for standard environmental analyses.

- 17 different multi element standards
- Quality control standards
- Surface water analysis ①
- Sewage sludge analysis ②
- 12 months shelf life for unopened bottle & 6 months after the bottle has been opened

Multi-element standards for the ICP-MS ready-to-use

(Inductively Coupled Plasma - Mass spectrometry)

The standard solutions are manufactured from high-purity starting material (as a rule ≥99,999 %) under clean room conditions. Acids (purified by means of sub-boiling distillation) and water of highest quality are used to manufacture the solutions.
The solutions are certified and can be traced to NIST standard reference solutions. Solutions are produced according to **ISO 17034** in an accredited environment. The solutions are tested in a laboratory accredited to **ISO/IEC 17025** and supplied with a detailed, batch-specific certificate of analysis.
The range encompasses 19 different multi-element standards in various compositions for tuning, calibration and interference tests.

ROTIPURAN® ULTRA / SUPRA

Acids, Alkaline Solutions and Water for trace analysis via ICP-OES, ICP-MS, AAS and IC

Roth provides two high quality product lines, **ROTIPURAN® Ultra & Supra** specially for research, trace analysis and electronics.
These ultrapure reagents are produced using a technologically complex distillation process (subboiling distillation) and are filled only into specially selected, suitable containers under clean room conditions. Very extensive production and quality controls guarantee extremely high quality.

Analysenzertifikat
CERTIFICATE OF ANALYSIS

ROTIPURAN® Ultra

This ultrapure product line is characterised for its especially high purity **(in ppt-quality)** and fulfils the highest purity requirements. The metal content of these products is below 100 ppt [parts per trillion=10^{-12}] while key metals are under 10 ppt. These products are used in ultra trace analysis (via ICP-OES, ICP-MS, AAS, IC) and for applications in the electronics industry. The reagents are bottled and offered in high class fluoropolymer plastic bottles (PFA and FEP).

Features:
- Specified metal content: less than 100 ppt
- Preponderant metals are under 10 ppt
- More than 65 analysed metals
- Produced and bottled under clean room conditions
- Continuous process control for highest product purity
- Bottled exclusively in purified fluoropolymer bottles
- Highest purity and maximum product safety

ROTIPURAN® Supra

This supra quality line **(in ppb-quality)** is perfectly suitable for sample preparation in trace analysis (e.g. via ICP-OES, AAS, IC, etc.). Over 60 elements are specified and their content is below 1 ppb [parts per billion =10^{-9}]. Bottled and delivered in special plastic bottles.

Features:
- Maximum metal contamination: <1 ppb
- 60 specified metals
- Produced and filled under clean room conditions
- Bottled in special lightweight bottles for greater safety and easier handling. 2,5 liter bottles have got a handle
- HF is delivered with additional drop spout for safe handling
- Extremely economical purity for most analytic applications

ROTIPURAN® Low Organic:
TOC (Total Organic Carbon) - content: <20 ppb

Ultra / Ultra HF dispenser

For dispensing highly pure acids and alkalis.
Suitable for use in ultra trace analysis.

Features:

- **Free of metals**
- Made of high quality and highly pure plastics (PTFE, TFM and PFA)
- Calibrated and mechanically tested for precision and accuracy
- 38-430 thread (fits ROTIPURAN® Ultra products)

Special features of Ultra dispenser:

- Acid cleansed
- Manufactured in cleanroom (class 100)

Special features of Ultra HF dispenser:

- Specially for dispensing hydrofluoric acids
- Also suitable for analytical acids

When using bottles with a GL45 thread, please order fastening for dispenser KK11.1 separately.

Accessories for Ultra/Ultra HF dispenser

Bottle holder

Stabilises bottle when using a dispenser. The four-screw system is suitable for both square bottles and round bottles. The bottle holder is designed for ROTIPURAN® Supra and Ultra bottles with capacities from 250 ml to 2 litres. Also suitable for bottles with a diameter from approx. 7,0 cm to 11,5 cm.

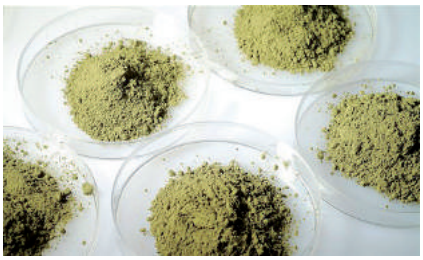
ROTI®METIC

(**Met**al **I**norganic **C**ompounds) Ultra Pure Metals and Inorganic Compounds

The ROTI®METIC product range comprises more than 130 high purity inorganic metals and metal compounds with purity levels ranging from 99,9 % (3N) to 99,9999 % (6N). Modern production technology as well as high quality and safety standards make it possible to achieve these high purity levels of metal traces from 100 ppm to 1 ppm.
Up to 60 trace metal compounds are analysed by HR-ICP, ICP-OES, AA, GD-MS and documented in the batch specific certificate of analysis supplied with the product.
Our ultra high purity metals and metal compounds are ideal for the following applications:

- Instrumental analytics
- Chemical analyses & syntheses
- Crystal growth technology
- Nanotechnology
- Photovoltaic technology
- Optical fibres
- Laser technology
- Photonics
- Fuel cells
- Catalysis



Our mission is to offer the quality and service you require in research & development and in production.

Excellent value for money and the option of ordering in semi-bulk are strong arguments in favour of the ROTI®METIC product range.

ROTI®REMETIC

Rare **E**arth **Met**al **I**norganic **C**ompounds

Our ultra high purity rare earth metal compounds work excellent for:

- Instrumental analytics
- Chemical analyses & syntheses
- Crystal growth technology
- Catalysis
- Doping agents
- Luminescent & fluorescent compounds
- Glas fibre technology
- Laser technology
- Fuel cells
- Oxidizing agents
- Electronic industry
- Ceramic manufacturing

Our mission is to offer the quality and service you requirein research & development and in production. Excellent value for money and the option of ordering in semi-bulk are strong arguments in favour of the ROTI®REMETIC product range.

Phosphonic acids

Alkylphosphonic acids are perfect hydrophobization ligands, owing to their classical bifunctional chemical structure. They contain an non-polar organic hydrophobic alkyl chain and an active hydrophilic phosphonic acid group. These molecules are capable to strongly bind to the surface of different inorganic materials (SiO_2, Al_2O_3, TiO_2, Fe_xO_y, ZrO_2, ZnS etc.) forming a selfassembled coating layer. Phosphonic acids can also be used as ligands for the synthesis of nanoparticles to control the size and hydrophobic properties of the particles. Further they are well soluble in non-polar and many polar solvents. The acids are also soluble in water (especially upon addition of alkali) at lower concentrations.

Quantum Dots (QD)

Quantum dots are fluorescent nanoparticles of certain semiconducting materials, whose electronic properties closely depend on the size of the particles.
The fluorescence wavelength shifts towards red for larger particles, and to blue for the smaller ones.
This allows coverage of the complete visible colour spectrum with quantum dots of different sizes and yet the same material. The possibility to control the size of the particles during their manufacturing, allows to precisely adjust their electronic and fluorescent properties. The inorganic nature of quantum dots makes them far more stable than organic fluorescent dyes.
Moreover, the surface of quantum dot particles is modified with carboxylic groups, which makes them highly soluble in water and enables covalent conjugation with proteins and other molecules.

Desiccants

Desiccants can absorb water and bind it chemically (reversibly or irreversibly) or physically.

The main desiccants can be subdivided into four categories:
- non-renewable chemical desiccants
- renewable chemical desiccants
- silica gels
- molecular sieves

Silica Gels

Silica gels protect moisture sensitive goods or chemicals during storage and transport. They are suitable for drying virtually all gases and solids.

Silica gels have a broad spectrum of application in the laboratory and in technical and industrial sectors:

- Possible applications in the laboratory are in desiccators, drying towers and in absorption tubes
- In the industrial sector they are mainly used in drying plants and with various types of packaging
- Are not suitable for drying liquids and alkaline substances

Silica Gel Blue

Alternative product: economically priced and environmentally friendly silica gel.

- **Free of cobalt(II) chloride**
- Colour change from blue to fuchsia
- Regeneration in drying cabinet at approx. 80-100 °C for approx. 2-4 hours

Silica gel blue

2-4 mm, with colour inidicator, pearls

Drying agent

Drying pearls blue; colour change from blue to pink. Silica gel with a mixture of different indicators. Free of cobalt(II) chloride. Colour change form blue to fuchsia.

Type analysis:

Particle size. ..... 2-4 mm
Adsorption capacity:
20 % rel. humidity. ..... approx. 8 %
50 % rel. humidity. ..... approx. 20 %
Filled under protective gas. Change in colour from blue to fuchsia.
Regeneration at ~80-100 °C, approximately 2-4 hours.

Silica Gel Orange

The environmentally friendly, alternative product to Blue Gel, used in the past.

Properties:

- Total adsorption capacity is similar to Blue Gel (Silica Gel Blue)
- Large surface (approx. 750 m^2/g), enables high absorption capacity of steam
- Adsorption capacity: approx. 40 wt% at 80 % relative humidity
- Patented humidity indicator - **heavy metal free**
- **Colour change from orange to colourless at approx. 6 wt% load**

Silica gel orange

2-5 mm, with colour indicator, pearls

Drying agent

Drying pearls orange; colour change from orange to colourless.

Type analysis:

Particle size. ..... 2-5 mm
BET-surface. ..... approx. 750 m^2/g
Adsorptive capacity:
10 % rel. humidity. ..... approx. 6,5 weight %
80 % rel. humidity. ..... approx. 42 weight %
Filled under protective gas. Colour change from orange to colourless at approx. 6 weight-% load. Regeneration at 130 °C, approx. 4 hours.

Desiccant Sachets

Desiccant sachets protect valuable and sensitive goods against dampness.

Properties:
- Manufactured from white long fiber paper
- Filling: Silica Gel Orange (colour change from orange to colourless at 15-20 wt% shows the degree of saturation of the sachet)
- The different sized bags and different volumes enable multi-purpose application.

Application:
Used in packaging for storage and transport to protect sensitive electronic instruments, equipment, machine parts, chemical products and goods against dampness.

Regeneration:
Is not possible for the desiccant bags, as the long fiber paper is not temperature-stable.

Desiccant sachet Silica gel orange

10 g (4x9 cm), with indicator

Type analysis:
Adsorption capacity:
20 % rel. humidity. ..... approx. 10 %
40 % rel. humidity. ..... approx. 19 %
50 % rel. humidity. ..... approx. 23 %
Colour change from orange to colourless. Regeneration is not possible.

Silica Gel without colour indicator

- Non toxic
- Regeneration at 130-150 °C for approx. 4 hours
- Easy to handle
- Can be mixed with Silica Gel Orange/Blue
- Unproblematic disposal

Drying Agent
Silica Gel
SiO_2

Silica gel industry grade

pearls, without indicator

Universal drying agent, drying of buildings.

Suitable, for example, for:
- drying buildings
- drying carpets and furniture
- and much more

Application:
- distributing approx. 6-8 kg/m². Caution! Standing water must be removed beforehand
- keep windows and doors closed. Turn off heating.
- depending on moisture level, the dry pearls can be removed after approx. 1-10 days
- checking for water absorption: dry 1 kg of moist product in oven for approx. 4 hours at 130-150 °C and weigh subsequently. If the weight difference (=water absorption) is approx. 360 g, the product should be replaced

Type analysis:
Appearance. ..... pearls, colourless to brown
Particle size. ..... 1-2,3 mm
BET-surface. ..... approx. 750 m²/g
Adsorption capacity:
10 % rel. humidity. ..... approx. 6 weight %

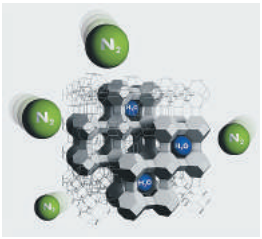
In order to achieve low residual water content over the silica gel, the capacity can only be utilised partially. The less silica gel is loaded with water the more intensively it dries. For example, to achieve a residual water content of 1 mg/l the loading must not be higher than 5,2 g water / 100 g silica gel.

DURAN WHEATON KIMBLE
Material DURAN®



Desiccator sets
Made of DURAN®. Designed for use up to the maximum technically possible vacuum (0 mbar).
Delivery without porcelain dessicator plate. Please order separately.

① **Includes lid with knob, without connection**
For drying moist products as well as storage of moisture-sensitive substances.

Molecular Sieves

For drying, cleaning or separating liquids and gases.

Properties:
- Spherical metal aluminium silicates
- Spheres ∅ 1,6-2,5 mm and 2,5-5,0 mm
- Active surface: 600-700 m^2/g
- Activated at 500-600 °C; we nevertheless recommend activating the molecular sieve again before using it for the first time

Typical application:
- In desiccators, drying tubes, columns
- For drying streaming gases
- For absoluting organic solvents
- For separating organic solvents

Regenerating:
- In drying cabinets at 200-300 °C
- Through pressure change or rinsing

Ion Exchanger

The ion exchanger offered in our range differ depending on their application and requirements. Three different types are available:

- **Mixed bed ion exchanger**
- **Classical cation and anion exchanger**
- **Cation and anion exchanger for analytical purposes**

Typical applications:
- Water treatment
- Pharmaceutical industry and biochemistry
- Production and purifying of chemicals
- Classical laboratory analysis

Amberjet™ Mixed Bed Ion Exchanger

Amberjet™

mixed bed exchanger, highly pure

Mixed bed resin made of highly regenerated strongly acidic cation exchanger and strongly basic anion exchanger. Especially suited for all demanding applications, e.g. for disposable cartridges in systems with highly purified water in the electronics industry. Manufactured by a special process allowing the production of highly purified water as far as organic impurities and others are concerned. Contains stoichiometric amounts of cation and anion exchanger capacities.

Ion Exchanger Roti®change

Roth's product range Roti®change contains ion exchanger, which are particularly suitable for analytical purposes. The corresponding polystyrene based resins were specially purified to reduce extractable residues to less than 1 mg/g resin.

Cation exchange resins
Our cation exchange resins are available as 4 % and 8 % divinylbenzene (DVB) cross-linked polymers with sulphonate as active group. All cation exchange resins are provided in hydrogen (H^+) form.

Typical applications are: removal of ethidium bromide/propidium iodide from DNA samples; separation and preconcentration of amino acids, peptides and nucleotides; desalting (removal of cations) and separation of metal ions.

Anion exchange resins

Our anion exchange resins are also available as 4 % and 8 % divinylbenzene (DVB) cross-linked polymers but with quaternary amines as active groups. All anion exchange resins are provided in chloride (Cl^-) form. Typical applications are: exchange of anions of salts; cyclic nucleotide assays and fractionation of organic acids.

Celite® - Silicate Basis

Prepared and standardized celite for application as a filtering aid or as carrier material in column chromatography.

Composition:
approx. 90 % SiO_2, 2-5 % Al_2O_3, 1-4 % Fe_2O_3 and various other oxides in a low concentration, that is why the Celite® may be slightly tinted.
